SAFETY GUIDE OF CARBIDE PRODUCTS

KORLOY Inc. is continuously trying to develop safer and higher quality products
Please be aware of the safety guidelines below prior to using KORLOY Inc. products

- It is generally accepted that the proper handling of cemented carbide tools requires awareness of safety as noted above. For more information, please contact us.
- KORLOY does not accept any responsibility for any accident caused by inappropriate use, abuse of tools, or changes to the products.

1. PL (Product Liability)

In accordance with the PL (Product Liability) law, we have attached a WARNING label on the case of KORLOY products.
There is no warning on the surface of the tools. Please read this safety guidelines before using carbide tools and provide safety education to all users.

2. Basic characteristics of CEMENTED CARBIDE tools

Cemented carbide tools are made of carbides, nitrides, carbonitrides, oxides of Tungsten (W), Titanium (Ti), Alluninyum (Al), Silicon (Si), Tantalum (Ta), Boron (B) etc and metal omponent like Cobalt (Co), Nickel (Ni), Chrom (Cr), Molybdenum (Mo) as binder. Cemented carbides tools have high hardness and specific gravity.
Generally there's no smell but according to usage and treatment, appreance and color could be changed

3. Precaution for CEMENTED CARBIDE tools

1) Cemented carbides are extremely hard and brittle at the same time. Impact shock or excessive clamping power could cause fracture or breaking of the tool.
2) Cemented carbides have large sepcific gravity, thus they require special attention as a heavy material when you handle big sizes or large quantities.
3) Cemented carbides have different thermal expansion coefficient with steel and ferrous materials. Shrink fit or swell fit products may cause trouble if they are used at undesirable conditions like extremly high or low temperatures.
4) There are several cemented carbide products having sharp cutting edges.Be careful not to handle the tools with bare hands which may cause cuts or injury, especially when removing the tools from the case, do not touch the cutting edge and be careful not to drop it.
5) Storing carbide tools in a corrosive atmosphere may cause erosion which can reduce toughness.
6) Please refer to the catalouge safety guidance prior to handling the tools.
7) Do not absue tools under inappropriate conditions.

4. Precaution for machining (grinding, welding, EDM) of CEMENTED CARBIDE tools

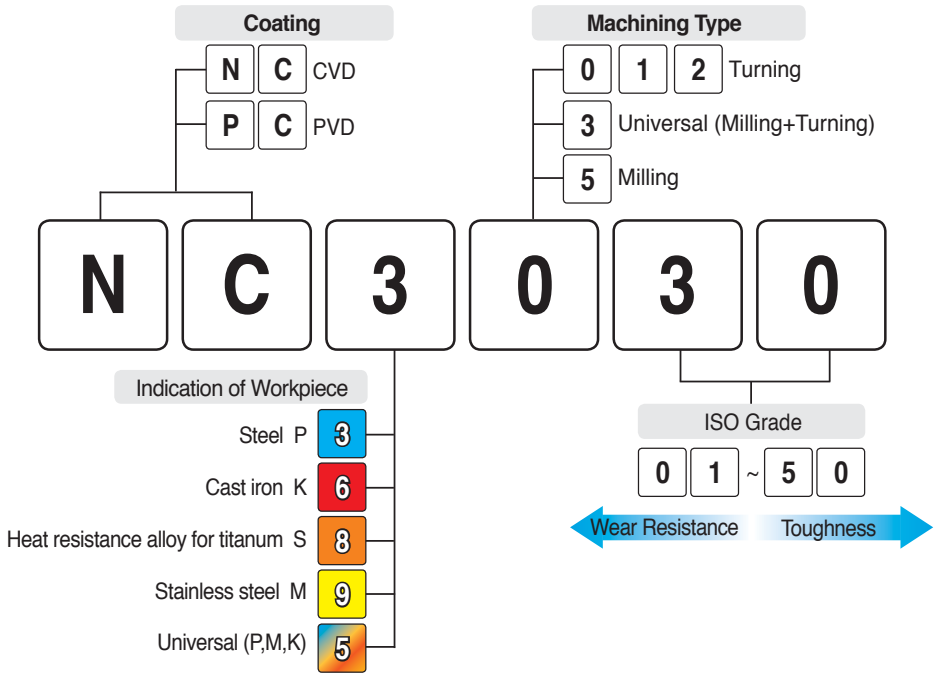

1) Surface condition can affect the toughness of the tool, so it is recommended to use a diamond grinding wheel.
2) Grinding of cemented carbide creates mist and dust. It contains harmful compositions like Cobalt (Co), thus it is recommended to use a mask, mist collection, and other protective facilities. If the dust gets in your skin or eye, rinse immeditely with continously running water.
3) In case of grinding with coolant, coolant contains harmful metal components which cause environmental problems. Handle the coolant according to the manufacturer's recommendations.
4) Check for cracks after re-grinding carbide tool and reuse.
5) Marking with laser or electric pen may cause cracks on the carbide tool. The crack can shortened tool life.
6) EDM of carbide may cause residual cracks on the carbide tool, so if necessary , remove the crack with a grinding process.
7) Brazing of carbide tools at extremly high or low temperatures compare with the melting point of brazing materials may cause loosening or breakage.
8) Overheating a oil base coolant may cause a fire or flames, thus be prepared for fire prevention.

5. METALCUTTING SAFETY

	DANGEROUS FACTOR	SAFETY COUNTERPLAN
Cutting tools	· Sharp cutting edge of cutting tools may cut your bare-hand	· Use gloves when pulling out the insert from the case or mounting it on the machine
	· Inappropriate conditions or usage may cause fragmentation and expel parts of tools which may cause injury	· Use glasses or safety cover for your safety · Use the tools within the recommended range · Please refer to catalogue and safety guidelines first
	· Severe load on tool and premature wear of cutting edge may bring excessive cutting force on tool, causing fracture of the tool and may cause injury	· Use glasses or safety cover for your safety · Change the tool as required before excessive wear or fracture
	· Chips evacuated during cutting are hot and sharp and maycause burns and cuts	· Use glasses or safety cover for your safety · Stop machining and put safety glove on and use a hook tool to remove chips
	· Touching the workpiece immediately after cutting may cause burns	· Use gloves or safety cover for your safety
	· Be aware of sparks, fire, or explosion of hot chips generated during the cutting operation	· Do not use at the place where having explosive materials · Prepare for fire extinguishments
	· In case of high RPM machining, vibration and chattering may occur due to the improper balance of the machine	· Use glasses or safety cover for your safety · Check first if there's any chattering, vibration or strange noises prior to your main cutting operation
	· Touching a burr remaining on the workpiece with a bare-hand may cause a cut	· Do not touch the burr with bare-hand · Use gloves or safety cover for your safety
	· Loose clamping of the workpiece may cause the tool to fracture and result in damage to the cutter body and possible injury	· Clamp the workpiece tightly
	· Tools are operated to right-hand direction normally · Left-hand direction operation can cause fracture of tool and body damage	· Do not use left-hand direction without notice · Check the package of product to check the availability of left-hand operation
Indexable tools	· Loose clamping of inserts and parts may result in ejection of the tool during cutting and may cause serious injury	· Check the clamping of inserts and parts prior to machining,and use original parts only
	· Over loaded clamping of inserts by a lever (such as a pipe) may cause dangerous fracturing of parts and inserts	· Do not use lever inappropriately
	· In case of high speed machining, parts and inserts can be forced out by centrifugal force	· Use within recommended condition · Use glasses or safety cover for your safety
Rotating tools	· Since cutter has sharp cutting edges touching with a bare-hand may cause a cut	· Use gloves or safety cover for your safety
	· It is dangerous to use glove with rotating machine · Contact with body or clothes is dangerous with rotating parts	· Do not wear gloves when you work with rotating machine · Keep your body and clothes away from rotating machine
	· Vibration generated by balancing trouble may cause a fracture and ejection of the tool which may cause serious injury	· RPM should be controled within recommended condition · Check the balance of rotating part periodically
	· In case of drilling, the uncut bottom core can fly out of the part with high speed and cause serious injury	· Use gloves or safety cover for your safety
	· The edges of small diameter drill are sharp and easy to break	· Use gloves or safety cover for your safety
Brazed tools	· Fragmentation and ejection of brazed carbide tip may cause injury	· Check the brazed tip before using · Do not use at high temperature cutting condition
ETC	· There's a possibility of breaking the carbide tip after several brazing	· Do not use brazing a tip that has been brazed several times
	· Abusing may cause fragmentation of tool and is very dangerous	· Stick to safety regulations and guidelines

MP		• For medium cutting of steel • 4 dots for improved chip control in medium cutting to finishing • Stable chip evacuation at high depth of cut • Stable tool life due to lower cutting loads at high feed • Recommended depth of cut: 0.020~0.157 inch
MM		• For medium cutting of stainless steel • Limits plastic deformation caused by heat • Stable tool life thanks to the balanced cutting performance and toughness • Stable chip flow at high speeds and feeds • Recommended depth of cut: 0.020~0.197 inch

Application area of chip breaker

VQ : Depth of cut, ap = 0.020~0.098 inch / feed, fn = 0.002~0.012 ipr
MP : Depth of cut, ap = 0.020~0.157 inch / feed, fn = 0.006~0.016 ipr

Auto Tools (ISO type)

- ISO inserts for automatic lathes
- Precise R shape with the use of minus tolerance of nose R
- Tolerance class precise enough in no need for adjusting tools with the use of accurate cutting edge height
- Sharp blade for excellent chip control and surface roughness with low cutting force
- High precision tools for electrical/ electronics instruments and medical instruments

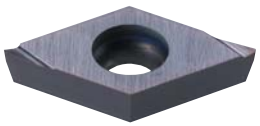

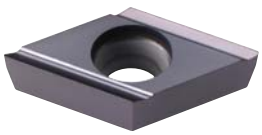

Code system (ISO type)

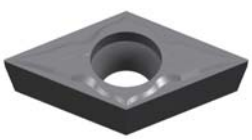

KF/KM chip breaker, ground type for grooving

- Ground chip breaker with sharp cutting edge
- High precision insert of E-class tolerance with accurate nose radius

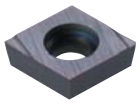

KF	KM
	
• For finishing • Low cutting loads with sharp cutting edges • Longer tool life due to lower chip evacuation resistance at high speed • Excellent surface roughness	• For medium cutting to finishing • Better chip flow due to wide chip pockets • Longer tool life and better cutting action due to improved chip evacuation • Excellent surface roughness

VP1/MS chip breaker

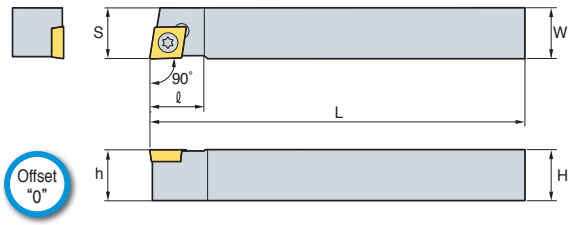

- Exclusive chip breaker for hard-to-cut materials such as titanium alloy, Inconel, stainless steel, etc.
- Minimized cutting heat by reducing contact area between chips and rake surface with the use of high positive blade

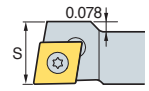

VP1	MS
	
• Hard cutting edge for medium cutting • Optimal width of chip breaker by each depth of cuts realizes wide workpiece machining.	• Good surface finish for medium cutting • Preventing welding in Titanium machining • Increasing chip evacuation in high feed machining • Protecting cutting edge due to structure for good chip evacuation

High pressure coolant for inconel machining

KHP Coolant new

KORLOY High Pressure Coolant

- 300% increased productivity on Inconel machining vs. low pressure coolant system
- Cooling, tool life, and chip control are improved by the high pressure coolant multi-directional injection system

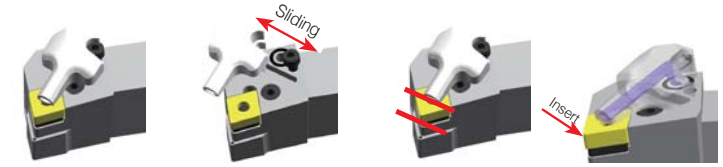

Structure of holder

※ Adaptor and high pressure hose are sold separately

Features

- The optimal distance between the insert and the jet orifice and the ideal place of the jet orifice
- Maximized loss pressure of coolant pressure due to streamlined design of internal path
- Easy to clamp an insert for sliding clamp system

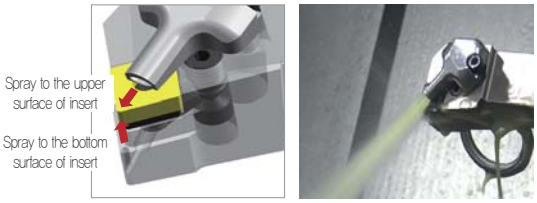

The original position of water clamp | The position of placing insert | Optimal position and distance of spraying | Oval direct spray

Turning and Grooving

Selection of insert

- Feed rate
  - Decide maximum feed rate after considering the insert's characteristics and machine capabilities (Fmax = W x 0.075)
  - Max feed rate should not be larger than the corner radius of the insert
  - In grooving applications, chip evacuation problems can be remedied by using step feed methods at small intervals
- Depth of cut
  - The minimum depth of cut should be bigger than corner radius of insert
  - When deciding on the max depth of cut please consider the machine's cutting load
  - Depending on the shape of the insert, deflection of work piece and clearance angle can be changed

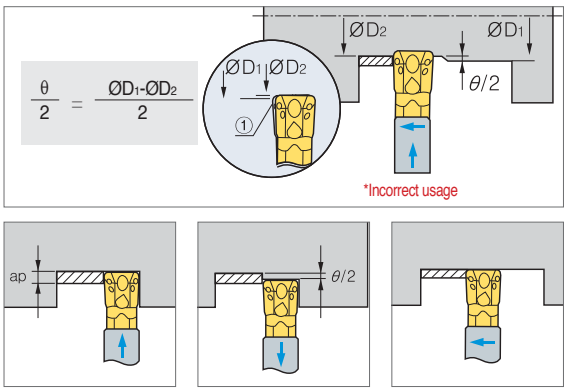

Notice for turning

- KGT/MGT tools are designed to incur side cutting force from its clearance angle; this feature gives you advantage over a standard ISO insert
- The standard MGT insert also provides a "wiper" effect to improve surface roughness

Notice for finishing (offset need final quality)

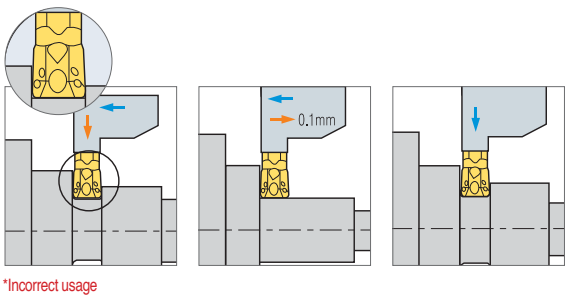

- After desired diameter is grooved, continuous turning operation might cause some deflection of the workpiece. In these cases follow the given formula, offsetting these factors enables the desired diameter that you want

- To eliminate the difference in the machined diameter by utilizing the clearance angle (which is commonly generated during the final turning operation) follow the directions above when machining
  To obtain a good surface roughness without offsetting in an application follows the directions below
  1) Groove to the desired diameter
  2) Pull the tool backs a total distance of θ/2
  3) Continue the external turning operation to desired diameter

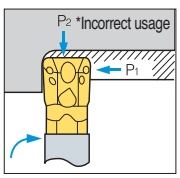

Notice for MGT turning applications

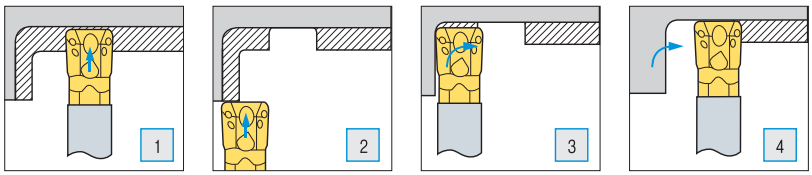

- KGT/MGT tools are available for grooving and turning as a multifunctional tool. When using a M.G.T tool keep in mind that the tool imitates a standard ISO turning application. The application uses a positive clearance angle where a tool's cutting force and depth of cut are all applied in an application. This might create normal wear on the insert, after turning, a grooving process might not meet the desired diameter on the work piece. To off set this, adjust the tool 0.004 inches and return to the original position of the grooving application

Machining workpiece with a radius bigger than the insert's corner radius

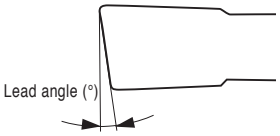

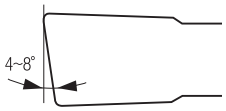

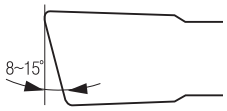

Stabilize your tool pressure. KGT/MGT tools create a cutting load when machining a workpiece with a radius larger than the corner radius of insert (shown in the picture). The unequal cutting force might initially break the insert or holder

Selection of Insert

- To properly match the insert and cutting condition, the following factors should be considered
  - Width of insert • Chip breaker • Grade and nose R
- The relationship between the cutting width and cutting depth
  - Neutral type, inserts with a 0-degree lead angle are best when used an applications maximum depth of cut
  - In general alloy steel, the maximum depth of cut = W x 0.8
- Insert with lead angle
  - To reduce burrs, we recommend using insert with a lead angle.
  - Insert that have larger lead angles reduce burrs but will also decreases tool life
  - In the case where burrs are acceptable, we recommend using a neutral type insert

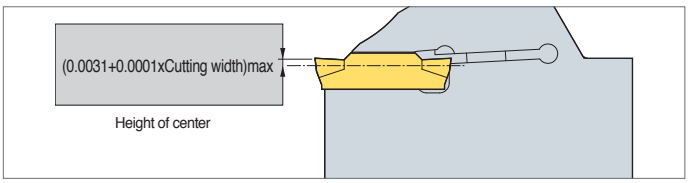

Setting of holders

- The cutting position should be exactly mounted on machined axis in order to create a perpendicular direction or 90 to minimize vibration

Setting of parting off

- The edge height of an insert should be set within ±0.039 inch based on the center line
  - Parting off should be done as close to the chuck as possible to minimize vibration

Notice

- Keep a consistent cutting speed and feed
- Use proper amounts of coolant for better performance
- Properly clean the insert pocket before mounting insert

Usage

- If insert is worn, immediately replace with a new insert. This is to prevent the damage on the workpiece
- If the holder seat is worn or damaged replace with a new one immediately for stable clamping
- Do not grind or regrind the holder seat

Selection of chip breaker

- Our chip breakers are designed to narrow chips during grooving operations. Narrow chips usually offer the following advantages
- Decreases friction between chips and the workpiece. This usually gives a better surface roughness finish
- With better chip flow, a machinist is able to increase feed rates due to a reduced cutting load

Face grooving tools

For shallow grooving

- Economical tools utilizing a double ended cutting edge system
- Newly designed chip breakers that help ensure chip control for various face grooving applications
- Korloy face grooving tools provide various holder line-ups to give you more options and benefits

Selection system of holder

- Follow these 3 simple directions to choose the right insert and holder for your application

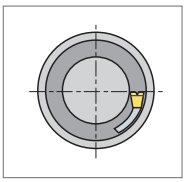

Insert and holder

Choose an insert and holder that best applies to your application according to the cutting width and part of workpiece to be machined.

Holder Tmax

Choose the holder with the shortest overhang that will still meet the cutting depth required

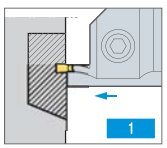

Machining Dia.

Choose the largest size of shank depending on the initial grooving diameter required in the application

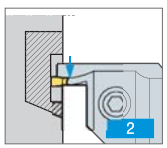

Notice: To minimize chattering, use the shortest holder according to Tmax.

Optimization of face grooving

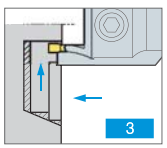

Roughing: When face grooving decreases the cutting speed 40% below a normal face turning operation

• Grooving at the initial diameter

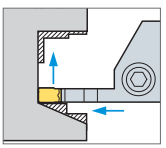

• Face turning away from center

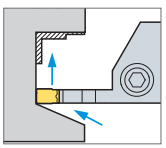

• Face turning to center

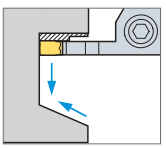

Finishing: When face grooving decreases the cutting speed 40% below a normal face turning operation

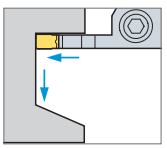

• Grooving at the initial diameter to the final cutting depth and face turning away from center

• Radius operation toward final dimension at the bottom

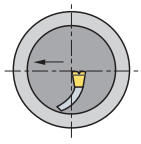

• Face turning to center

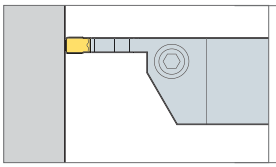

• Grooving for the right dimension you want

Notice for face grooving

- Before machining, check and adjust the following holder position

- Check the cutting edge height at the center of the workpiece
- Machine towards the center and check for burrs

- For better surface roughness, set up the insert in order to perpendicular at center line

Inserts are offered with two edges, for better economical machining

MGT

- Inserts are offered with two edges, for better economical machining
- Multi-function operations - Reduce cycle time & increase productivity with the ability to groove, turn, face or copy in an application
- Shorten time & save on tool cost - Korloy's MGT system allows a machinist to apply one tool against many applications, reducing the number of tools
- Flat Cutting Edge - MGT tools have a flat geometry on its cutting edge to ensure excellent surface finishes. Even in high Feed applications by using a wiper function, Korloy ensures excellent surface finishes in roughing operations

- There is a limit to cutting diameters of TB5-M when depth of cuts are over 0.197 inch
  (e.g. When cutting with a TB5200N-020-M insert at the depth of 0.244 inch, Ø2.362 D-MAX is available)
- N.L = No limit

Special features

External thread
A thread on the external surface of a cylinder screw or cone

Depth of thread
The distance between the crest and root measured from normal to theaxis

Pitch
The distance between the corresponding points on adjacent thread forms measured parallel to the axis. This distance can be defined in millimeters or by the tpi (threads per inch), which is the reciprocal of the pitch

Nominal diameter
The diameter of which the diameter limits are derived by the application of deviation allowances and tolerances

Major diameter
The largest diameter of a screw thread

Pitch diameter
On a straight thread, the diameter of an imaginary cylinder, the surface of which cuts the thread forms where the width of the thread and groove are equal

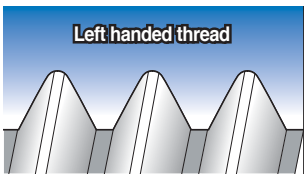

Minor diameter
The smallest diameter of a screw thread

Helix angle
For a straight thread, where the lead of the thread and the pitch diameter circle circumference form a right angled triangle, the helix angle is the angle opposite of the lead

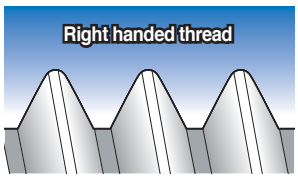

Straight thread
A thread formed on a cylinder

Taper thread
A thread formed on a cone

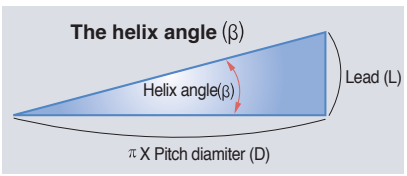

Internal thread
A thread on the internal surface of a cylinder or cone

A thread which, when viewed axially, winds in a counter clockwise and receding direction. All left handed threads are designated LH

A thread which, when viewed axially, winds in a clockwise and receding direction. Threads are always right handed unless they are specified

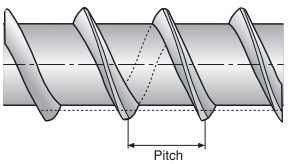

For a straight thread, where the lead of the thread and the pitch diameter circle circumference form a right angled triangle, the helix angle is the angle opposite of the lead

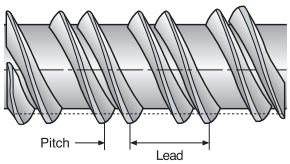

Machining a multi-start thread

- A thread in which the lead is an integral multiple, greater than one, of the pitch. A multi-start thread permits a more rapid advance without a coarser (larger) thread form

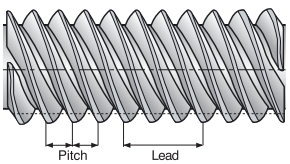

First start machined

Second start machined

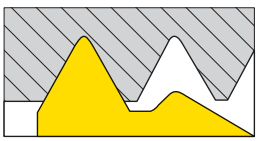

Third start machined (Final, 3 starts thread)

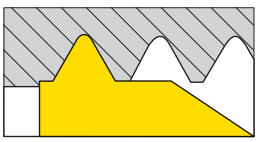

Insert profile style

Partial profile

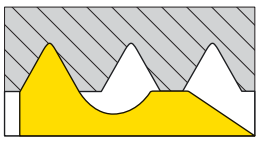

The V partial profile insert cuts without topping the outer diameter of the thread. The same insert can be used for a range of different thread pitches which have a common thread angle

Full profile

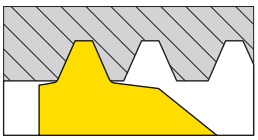

The full profile insert will form a complete thread profile including the crest. For every thread pitch and standard, a separate insert is required

Full Profile for fine pitches

The full profile for Fine Pitches will form a complete thread
The topping of the outer diameter is generated by second tooth

Semi full

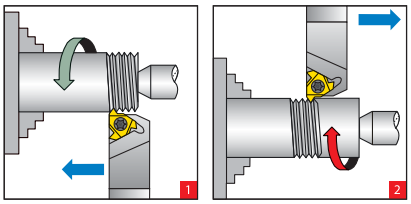

The Semi profile insert will form a complete thread including crest radius but without topping the outer diameter Mainly used for trapezoidal profiles

Calculating the helix angle (β)

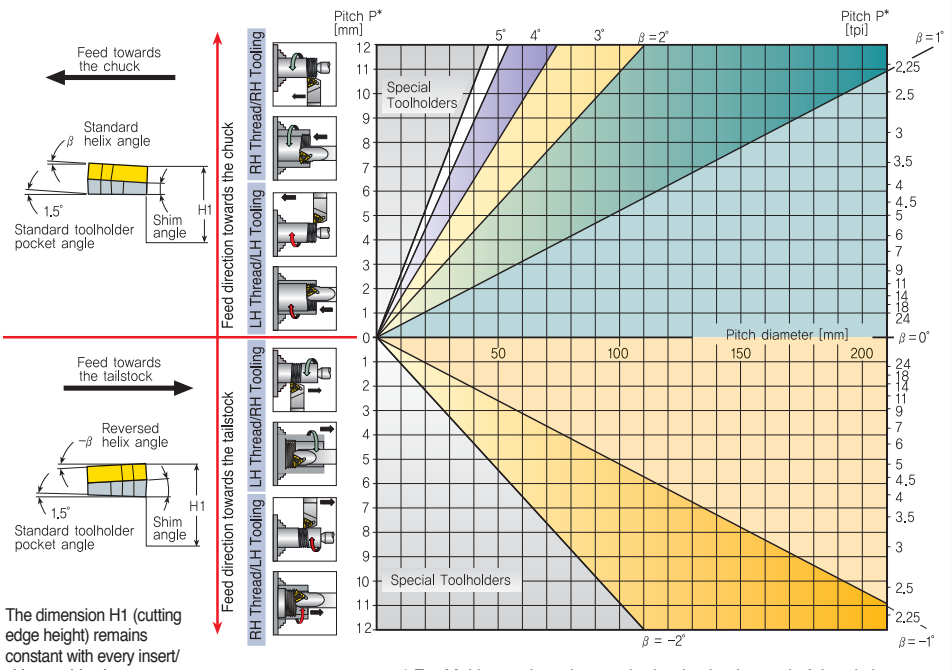

• The helix angle is calculated by the following formula:

$$\beta = \tan^{-1} \frac{P \times N}{\pi \times D}$$

β: Helix angle (°)
P: Pitch (inch)
N: No. of starts
D: Pitch diameter (inch)
Lead = P x N

• The helix angle can also be found from the diagram below

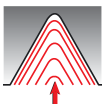

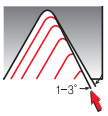

Helix angle diagram

The dimension H1 (cutting edge height) remains constant with every insert/ shim combination

* For Multi-start threads, use the lead value instead of the pitch

Thread infeed method

Infeed		Application		
	**Radial Infeed**	• When the pitch is smaller than 16 tpi • For material with short chips • For work with hardened material	→	Radial infeed is the simplest and quickest method The feed is perpendicular to the turning axis, and both flanks of the insert perform the cutting operation. Radial infeed is recommended in 3 cases
	**Flank Infeed (modified)**	• When the thread pitch is greater than 16 tpi. Using the radial method,the effective cutting edge length is too large, resulting in chatter. for TRAPEZ and ACME. The radial method results in three cutting edges, making chip flow very difficult	→	Flank infeed is recommended in the following cases
	**Alternate Flank Infeed**	• This method divides the load equally on both flanks, resulting in equal wear along the cutting edges. Alternate flank infeed requires more complicated programming, and is not available on all lathes	→	Use of the alternate flank method is recommended especially in large pitches and for materials with long chips

Trouble shooting

Problem	Possible cause	Solution
 **Increased flank wear**	Cutting speed too high	Reduce cutting speed/ use coated insert
	Depth of cut too low/too many passes	Increase the depth of cut per pass
	Unsuitable carbide grade	Use a coated carbide grade
	Insufficient cooling	Increase coolant flow rate
 **Uneven cutting edge wear**	Incorrect helix angle	Choose the correct shim
	Wrong infeed method	Use the Alternating Flank Infeed method
 **Extreme plastic deformation**	Depth of cut too large	Decrease depth of cut/ increase number of passes
	Insufficient cooling	Increase coolant flow rate
	Cutting speed too high	Reduce cutting speed
	Unsuitable carbide grade	Use a tougher carbide
	Nose radius too small	Use an insert with a larger radius, if possible
 **Cutting edge breakage**	Depth of cut too large	Decrease depth of cut/ increase number of passes.
	Extreme plastic deformation	Use a tougher carbide
	Insufficient cooling	Increase flow rate and/ or correct flow direction
	Unsuitable ca rbide grade	Use a tougher carbide
	Instability	Check stability of the system
 **Built-up edge**	Incorrect cutting speed	Change the cutting speed
	Unsuitable carbide grade	Use a coated carbide
 **Thread profile is too shallow**	The tool is not at the workpiece axis height	Change tool height
	Insert is not machining the thread crest	Measure the workpiece diameter
	Worn insert	Change the cutting edge sooner
 **Poor surface quality**	Too low cutting speed	Increase cutting speed
	Wrong shim	Choose correct shim
	Flank infeed method is not appropriate	Use the alternate flank or radial infeed method

- In order to perform a thread milling operation, a milling machine with three-axis control capability of helical interpolation is required.
- Helical interpolation is a CNC function producing tool movement along a helical path. This helical motion combines circular movement in one plane with a simultaneous linear motion in a plane perpendicular to the first. For example, the path from point A to point B (Fig,A) on the envelope of the cylinder combines a circular movement in the x-y plane with a linear displacement in the z direction
- On most CNC systems this function can be executed in two different ways:

  - GO2: Helical interpolation in a clockwise direction
  - GO3: Helical interpolation in a counter-clockwise direction

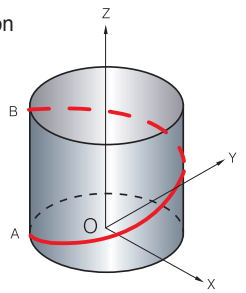

Fig. A

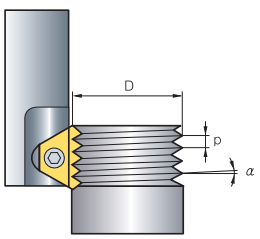

Fig. B

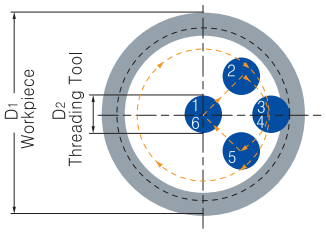

- The thread milling operation (Fig. B) consists of circular rotation of fhe tool around its own axis togerther with an orbiting motion along the bore or workpiece circumference. During one such orbit, the tool will shift vertically one pitch length. These movements combined with the insert geometry create the required thread form. There are three acceptable ways of approaching the workpiece with the tool to initiate production of the thread:

  1. Tangential Arc Approach
  2. Radial Approach
  3. Tangential Line Approach

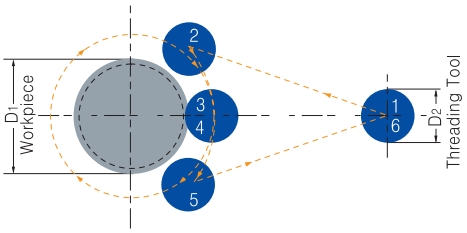

Tangential arc approach

- With this method, the tool enters and exits the workpiece smoothly. No marks are left on the workpiece and there is no vibration, even with harder materials. Although it requires slightly more complex programming than the radial approach (see below), this is the method recommended for machining the highest quality threads

Internal thread

External thread

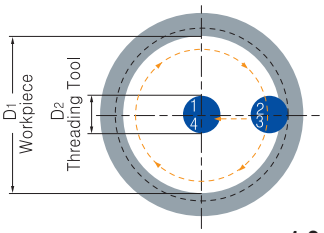

1-2: rapid approach
2-3: tool entry along tangential arc, with simultaneous feed along z-axis
3-4: helical movement during one full orbit (360°)
4-5: tool exit along tangential arc, with continuing feed along z-axis
5-6: rapid return

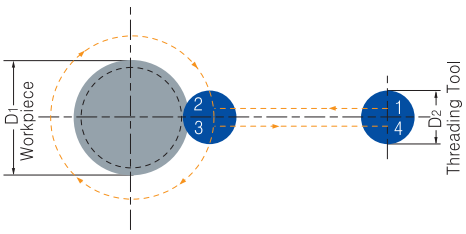

Radial approach

- This is the simplest method. There are two characteristics worth nothing about the radial approach:
  A. a small vertical mark may be lift at the entry (and exit) point. This is of no significance to the thread itself
  B. when using this method with very hard materials, there may be a tendency of the tool to vibrate as it approaches the full cutting depth
- Note: Radial feed during entry to the full profile depth should only be 1/3 of the subsequent circular feed!

Internal thread

External thread

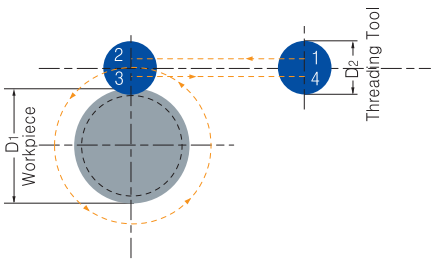

1-2: radial entry
2-3: helical movement during one full orbit (360°)
3-4: radial exit

Tangential line approach

- This method is very simple, and has all of the advantages of the tangential arc method.
  However, it is applicable only with external threads

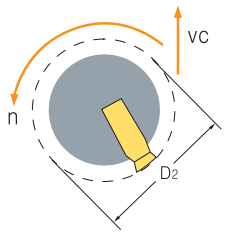

External thread

1-2: radial entry with simultaneous feed along z axis
2-3: helical movement during one full orbit (360°)
3-4: radial exit

Preparing for the thread milling operation

Calculation of rotational velocity and feed at the cutting edge

$$n = \frac{vc \times 12}{\pi \times D2}$$

$$vc = \frac{n \times \pi \times D2}{12}$$

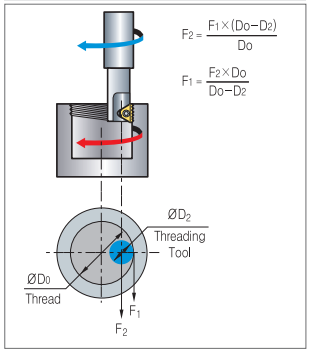

$$F1 = n \times z \times fn$$

n: Rotational Velocity (R.P.M)
vc: Cutting Speed (sfm)
D2: Tool holder Cutting Dia. (inch)
F1: Real Feed rate at the Cutting edges (ipm)
z: No. of Cutting Edges
fn: Feed per Rooth per Rotation (ipr)

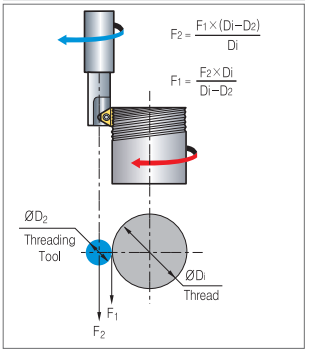

Calculation of feed rates at the tool center line

- On most CNC machines, the feed rate required for programming is that of the center-line of the tool. When dealing with linear tool movement, the feed rate at the cutting edge and the center line are identical, but with circular tool movement this is not the case The equations define the relationship between feed rates at the cutting edge and at the tool center line

External thread

Grades and applications

- Grade: PC9570T
- Application: First Choice for steel and cast iron, A tough sub-micron substrate with TiCN coating
  Provides good fracture toughness and excellent wear resistance

Trouble shooting

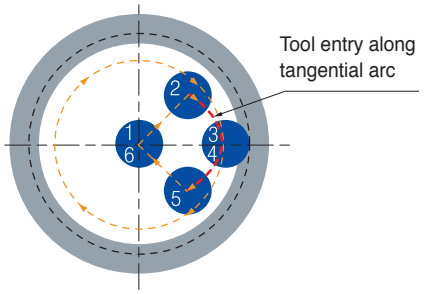

Problem		Possible	Solution
	**Increased insert flank wear**	Cutting speed too high	Reduce cutting speed/use coated insert
		Chip is too thin	Increase feed rate
		Insufficient coolant	Increase coolant flow rate
	**Chipping of cutting edge**	Chip is too thick	Reduce feed rate/Use the tangential arc method Increase RPM
		Vibration	Check stability
	**Material built-up on the cutting edge**	Incorrect cutting speed	Change cutting speed
		Unsuitable carbide grade	Use a coated carbide grade
	**Chatter/ vibration**	Feed rate is too high	Reduce the feed.
		Profile is too deep	Execute two passes, each with increased cutting depth/ Execute two passes, each cutting only half the thread length
		Thread length is too long	Execute two passes, each cutting only half the thread length
	**Insufficient thread accuracy**	Tool deflection	Reduce feed rate/Execute a “zero” cut

5 Cutting Edge Length, Diameter of Inscribed circle

S P K R 4 3 ED2 S R - MX

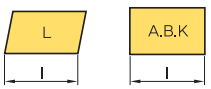

■ Metric system ※ Decimal integer constant

■ Inch system

· Use 1/32″ unit for a insert having smaller I.C under 1/4″
· Use 1/8″ unit for a insert having larger I.C over 1/4″

※ In case of rectangular and rhombic insert indicate cutting edge length instead of inscribed circle.

New serrated edge design increases productivity by reducing insert cutting load

Power Buster

- New tooling utilizing a specially designed serrated edge to increase productivity by reducing the cutting load.
- Double-sided 6 corner insert geometry ensures high rigidity, long tool life and cost efficiency
- The serrated edge divides the chips into smaller pieces. This feature provides excellent chip control, reduces interference of the cutter and ensures good durability of the cutter body.
- Two types of inserts are available-TNMX27 for PBA (AA: 45°) and PBZ (AA: 10°), and TNMX30 for PBP (AA: 0°)
- Application: High depth of cut and feed rate (Steel, Cast iron)

Features of insert

❶ Major cutting-edge (Serrated edge)

- Low cutting force
- Ideal for chip control, divides chips into small pieces for proper chip evacuation.
- Ideal edge design for Steel and Cast iron rough milling

• Comparison of chip control and cutting force

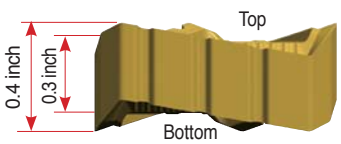

■ **Workpiece** 4140

■ **Cutting condition** vc = 656 sfm, ap = 0.32 inch, ae = 3.54 inch, fz = 0.012 ipt

❷ Thicker insert

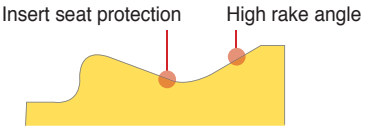

- Thick insert guarantees high rigidity
- Balanced insert design for stable mounting

❸ NM Chip breaker

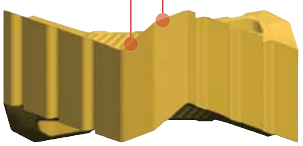

- High rake angle for low cutting force
- Good chip flow at various feed and depth of cut
- Inserts are protected with seats for a precise mounting
- Low friction and good heat evacuation at high depth cut

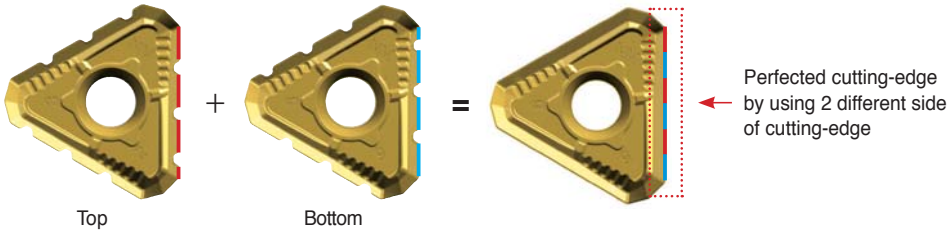

❹ Insert shape applied to PBA/Z cutters (AA: 45°/10°)

- High rake angle to avoid interference with chip
- Calculated minor cutting-edge angel for both AA 45° & 10° cutter

❺ Mirror system

- Cutting-edge on the both side of insert covers all overlapped cutting area

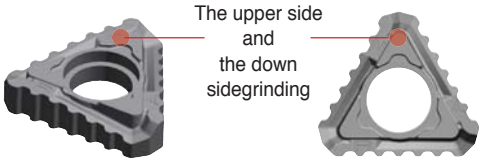

Features of cutter

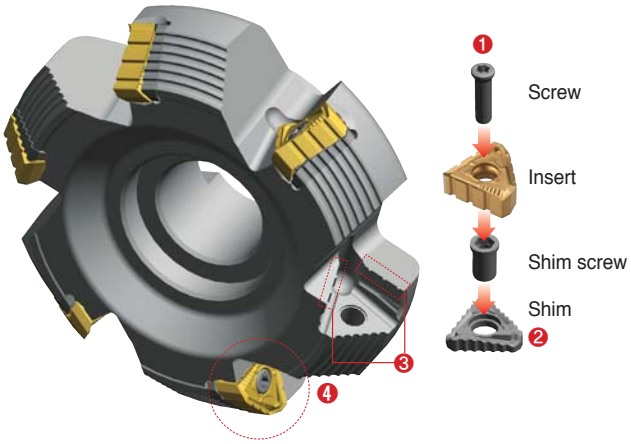

❶ Screw-on clamping system

- Simple and strong screw on clamping system

❷ Better rigidity & Stable Assembly system

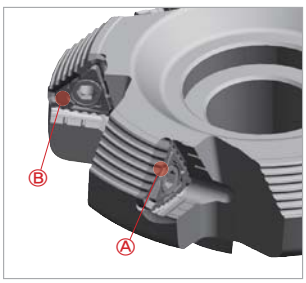

- The shim protects the cutter from insert damage
- High accuracy shim ensures tighter clamping

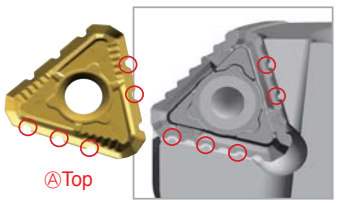

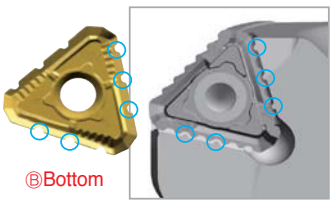

❸ Foolproof System

- Insert serrations match pocket design to prevent improper seating and alignment

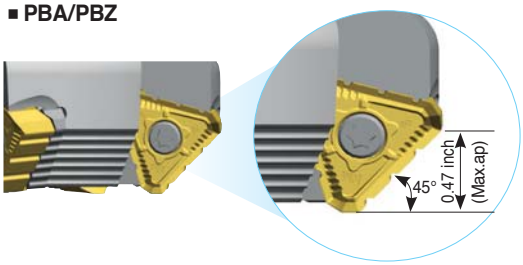

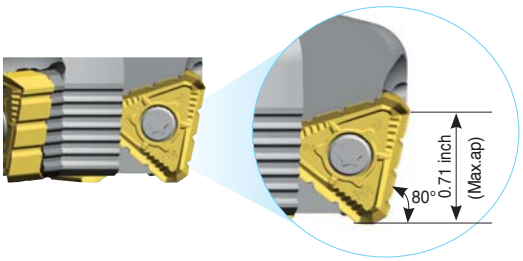

❹ Multi-application system

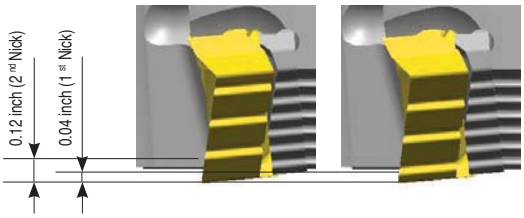

• Same insert for multi-use (45˚and 10˚)

■ PBA/PBZ

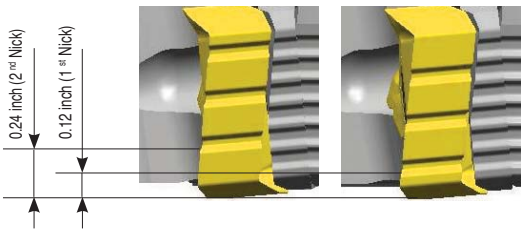

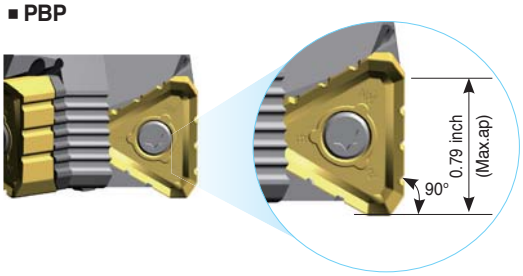

The serrations are effective with a depth of cut larger than 0.04 inch

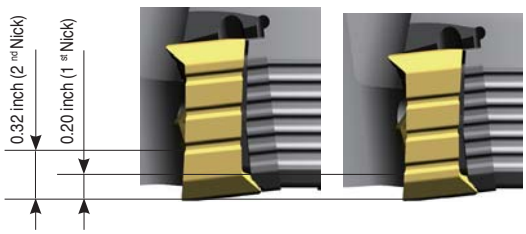

The serrations are effective with a depth of cut larger than 0.12 inch

■ PBP

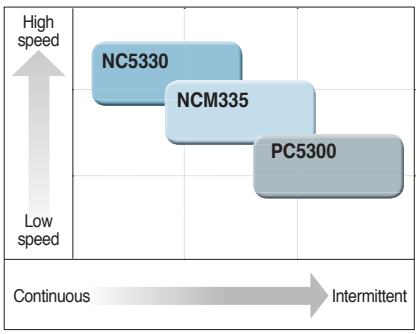

For the AA 90° cutter, nicks function properly at depth of cuts over 0.20 inch

Lighter tool ensures excellent performance in high speed machining

Aero Mill

- Excellent machining performance can be acquired especially at the high speeds due to the light aluminum cutter body that is 50% of the weight of a conventional steel cutter body
- High speed milling cutter for precise machining
- Special aluminum material and high rake angle of insert provide rigid & stable machining
- High tolerance surface finishes can be acquired due to the low cutting load provided from the high rake angle
- Balanceable up to G2.5 level

Assembly structure of cutter

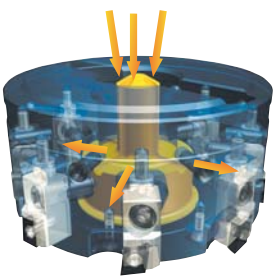

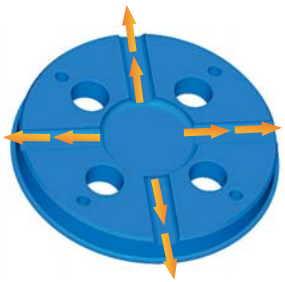

Features of cutter

- Increased stability based on cartridge type application
- Both insert and blade can be available in the same cutter
- Finishing to roughing can be possible because of wide chip pocket space
- Roughing and finishing available with carbide, PCD insert application
- Cutter breakage can be solved by making use of the chip cover

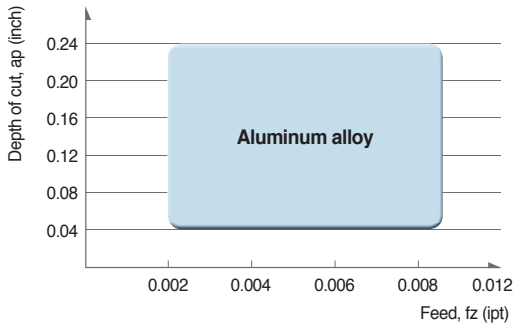

Coolant through system

- Specially designed coolant through system provides coolant from the center of the cutter to the insert enhances the cooling rate and chip evacuation.
- Direction of coolant has designed to focus directly to the insert cutting-edge to maximize chip evacuation and improve tool life
- Coolant bolt is applicable up to Ø6, coolant cover is applicable from Ø8 and over. Coolant devices are sold separately for through coolant system, through coolant arbor has to be used

High speed milling tool with PCD blade

Aero Mill-Plus

- Improve tool life up to 20% with a coolant system that enables direct spray cooling to cutting blades
- Enable high feed milling by increasing the number of cutting blades by 20% through a simply structured coupling method for clamps
- Reduces set up time up to 40% by applying a spanner adjustment method
- Introduce an aluminum cutter body to provide a superior cutting performance during high speed milling

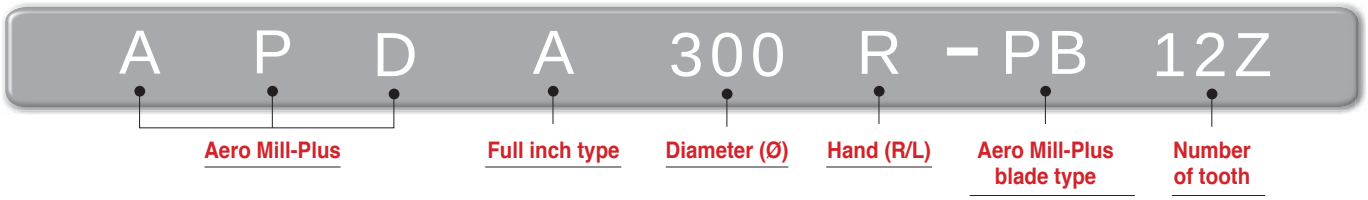

Assembly structure of cutter

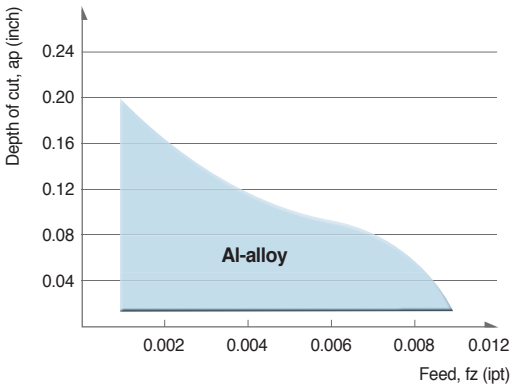

Features of cutter

- Prevent overload to the spindle bearings through weight reduction of the Al alloy body and enable high-speed processing
- Provide PCD Blade-dedicated cutter design to offer stable tool life and increase of applied blades
- Improve the blade life by applying a coolant system that enables direct spray cooling to cutting blades
- Adopt a clamping method with simple structure without set screw
- Reduce weight and apply a coolant bolt that is exclusively used for Aero-Mill Plus that applies coolant to remove internal chip

Various applications are available with multi-functional cutters

Alpha Mill

- Innovative curve cutting-edge and chip-breaker design ensures ideal 90-degree cutting, lower cutting resistance, and improved insert life.
- Various applications are available with multi-functional cutters. (Facing, Slotting, Square shoulder milling, etc.)
- Excellent performance ensured at large depth of cut operations due to strong cutting-edge and low cutting resistance.

Features of insert

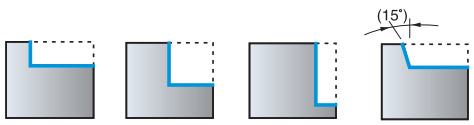

- Long tool life at high speed, high feed and deeper cutting by low cutting resistance and strong cutting-edge
- Distinguished features of Alpha-Curve reduce cutting resistance and improve cutting-edge strength and wear resistance

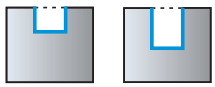

- Low cutting resistance is realized by KORLOY unique design-the alpha curve cutting-edge and optimal convex and concave design
- Highly efficient machining is available by the ideal application of the grade to material

Alpha Mill Nick new

- New nick cutting edge reduces cutting load
- High productivity
- APMT standard holders are compatible with Alpha Mill nick that is reducing stock management cost.

Features

• Lower cutting load due to the overlapping system

※ Nick types require both chip breaker types for application.

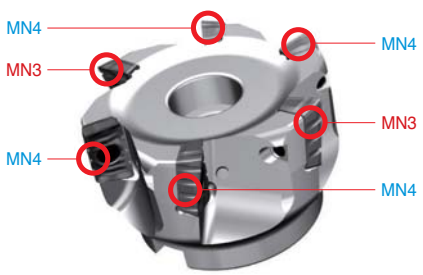

※ Can be used with the existing Alpha Mill holders. Use multi-edges for maximum results. (cutters with even-numbered teeth)

Type	Nick type		General type
Required No. of teeth	20		20
For AMCM3080M (4 Flute x 5 teeth)	 x 10 APMT16-**MN3**	 x 10 APMT16-**MN4**	 x 20 APMT16-**MM, MF, ML, MA**

How to clamp

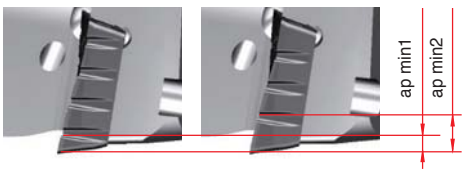

• Alternate the two types of chip breakers when clamping an insert.

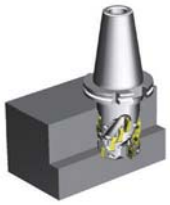

Min. depth of cut

• The depth of cut must be greater than ap min1 for chip breaking.

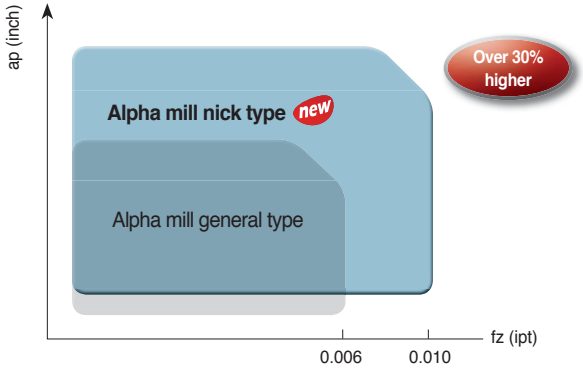

Type	ap min1	ap min2
APMT11 (2000 type)	0.063 inch	0.161 inch

Cutting condition formulas for milling

Cutting speed	RPM
$vc = \frac{\pi \times D \times n}{12}$ (sfm)	$n = \frac{vc \times 12}{\pi \times D}$ (min^{-1})

Feed (per tooth)	Feed (per minute)
$fz = \frac{vf}{Z \times n}$ (ipt)	$vf = fz \times n \times z$ (ipm)

Chip removal rate	Required machine power
$Q = ap \times ae \times vf$ ($inch^3$/min)	$Pkw = \frac{Q \times kc}{60 \times 102 \times \eta}$ (kW) $Php = \frac{Pkw}{0.75}$ (hp)

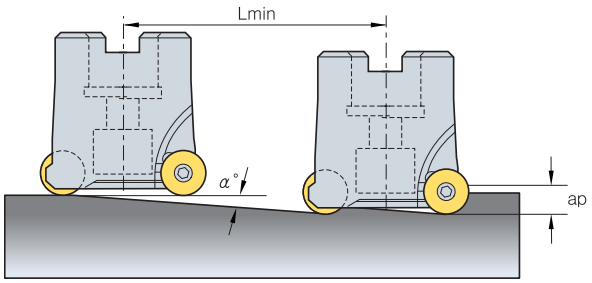

vc = Cutting speed (sfm)	**Pkw** = Required machine power (kW)
n = Revolution per a minute (min^{-1})	**Php** = Horsepower requirement (hp)
D = Cutting diameter (inch)	**Q** = Chip removal amount ($inch^3$/min)
De = Efficient cutting diameter (inch)	**ap** = Depth of cut (inch)
vf = Feed per a minute (ipm)	**ae** = Width of cut (inch)
fz = Feed per tooth (ipt)	**Kc** = Specific cutting resistance (MPa)
z = Number of tooth	η = Mechanical efficiency (%)
Pc = Power requirement (kW)

Maximum hole diameter table for helical machining (ØDH Max)

- ØD = Tool dia. (inch)
- Ød (Tool path, inch) = ØDH Min, Max - ØD
- ØDH Min (Minimum hole diameter) = ØD × 2 - Insert size (d)
- ØDH Max (Maximum hole diameter) = ØD × 2 - 2
- Ramping angle by ap (α°) = $\tan^{-1}\left(\frac{ap}{\pi \times Ød}\right)$

  Helical angle adjusted by ap cannot exceed maximum angle
- ap = Depth of cut

High Feed Milling Tool with 4 Corners for Small Diameter

HFMD new

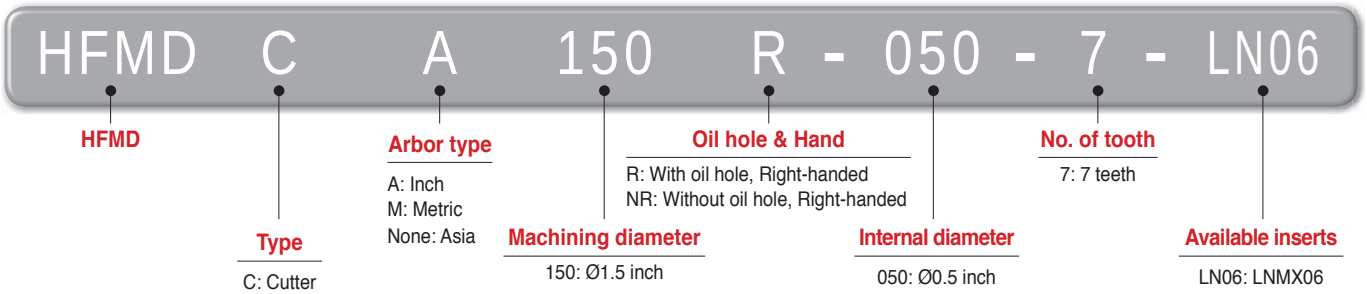

- Economical 4-corner double sided insert
- Increased productivity due to thinner and elongated shape of the insert which makes fine pitch available
- Insert designed for low cutting resistance with high rake angle and helix angle which reduces cutting load
- Inhibiting chipping and breakage due to concave clamping system and stronger screw

Code system

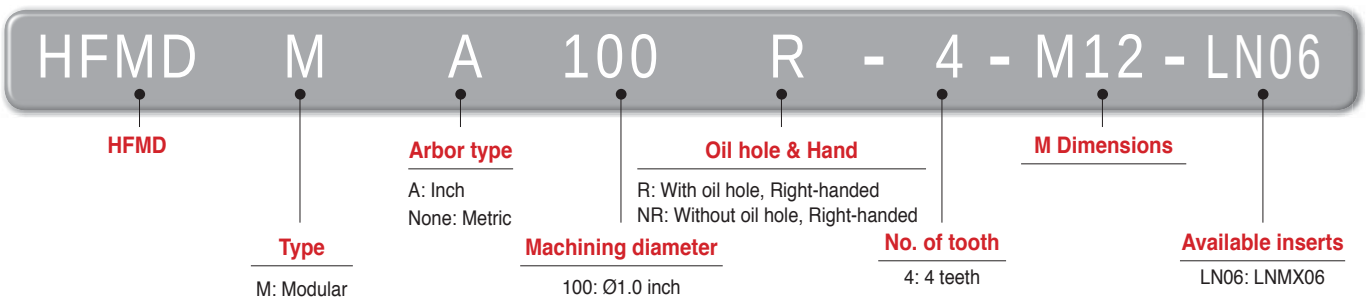

• Shank type

• Cutter type

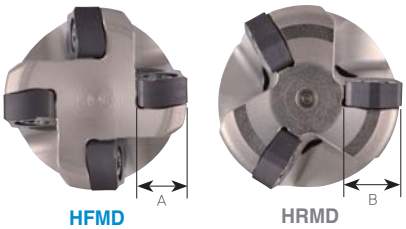

• Modular type

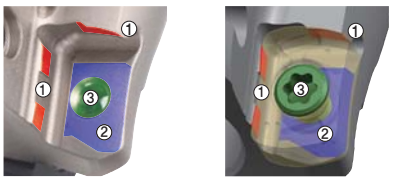

Features

• **Highly efficient insert due to fine pitch**
- Able to use fine pitch at the same machining diameter with typical types of milling cutters due to smaller inscribed circle (A < B)

※ Tool diameter: Ø1.0 inch

• **Insert with strong clamping force**
- ① Concave clamping system ② Wider bottom face clamping area ③ Applied a bigger size of screw

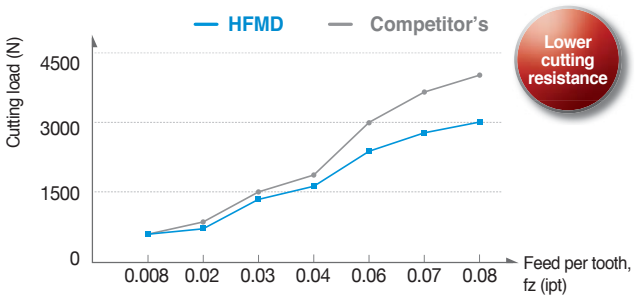

• **Insert designed for low cutting resistance**
- High rake angle and helix angle minimize cutting resistance compared to competitors' products and positive type of inserts

• **Economical 4-corner insert**
- Can use 4 corners with 1 insert by utilizing front/back face; High feed due to finer pitch

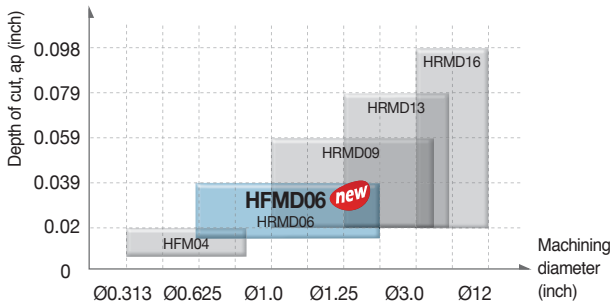

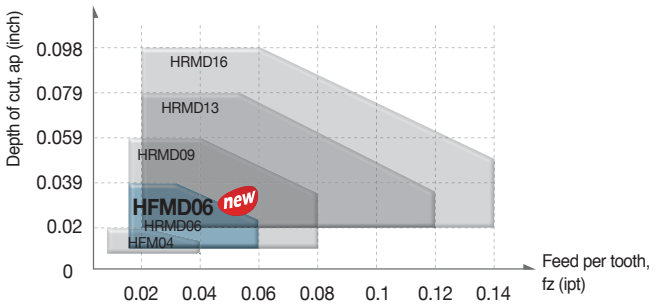

Features of chip breaker

Insert		Cutting-edge	Uses	Features
ML			For hard-to-cut materials For Ti & inconel	Ensures superior machining quality by applying a low cutting resistance chip breaker and high-strength cutting edge design suitable for machining hard-to-cut materials
MF			For light cutting	Suitable for light cutting with a low cutting resistance chip breaker design
MM			For multi-purpose	Available for most cutting area with its exclusive design suitable for general high feed machining

Machining example

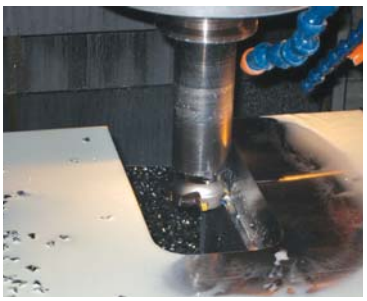

Working condition

- **Workpiece** AISI 1045 (SM45C, HRC22)
- **Cutting conditions**
  vc = 930 sfm
  fz = 0.055 ipt
  vf = 398 ipm
  ap = 0.032 inch
  ae = 1.378 inch
  Coolant: Dry, Machining: Copying
  Machine: MCT (Horizontal)
  Overhang of tool: 10 inch
- **Tools** **Insert** WNMX130520ZNN-MM
  Holder HRMDCA13200HR-4

40% Increased productivity
80% Reduced tool cost

Test result In comparing HRMD with our competitor using the same cutting conditions, the cutting speed of HRMD was higher with the same depth of cut (ap×ae), the cycle time was reduced by 40% and the tool life was increased to over 60%. HRMD is economically more efficient due to the use of 6 cutting-edges compared to EDNW type with positive insert

Working condition

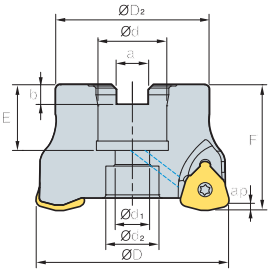

- **Workpiece** AISI 304 (STS304)
- **Cutting conditions**
  vc = 430 sfm
  fz = 0.047 ipt
  vf = 117 ipm
  ap = 0.04 inch
  ae = 3.15 inch
  Coolant: Wet, Machining : Facing and Slotting
  Machine: MCT (Horizontal)
  Overhang of tool: 10 inch
- **Tools** **Insert** WNMX130520ZNN-MM
  Holder HRMDCA13400HR-6

80% Increased productivity
25% Reduced tool cost

Test result In comparing HRMD with our competitor using the same cutting conditions, the cutting speed of HRMD was higher with the same depth of cut (ap×ae), the cycle time was reduced by 80% and the tool life was same, but HRMD is economically more efficient due to the use of 6 cutting-edges compared to SDKN type with positive insert

This milling tool series with its tangential clamping system increases stable machining and productivity, while improving perpendicularity

Tangen-Pro TP2P new

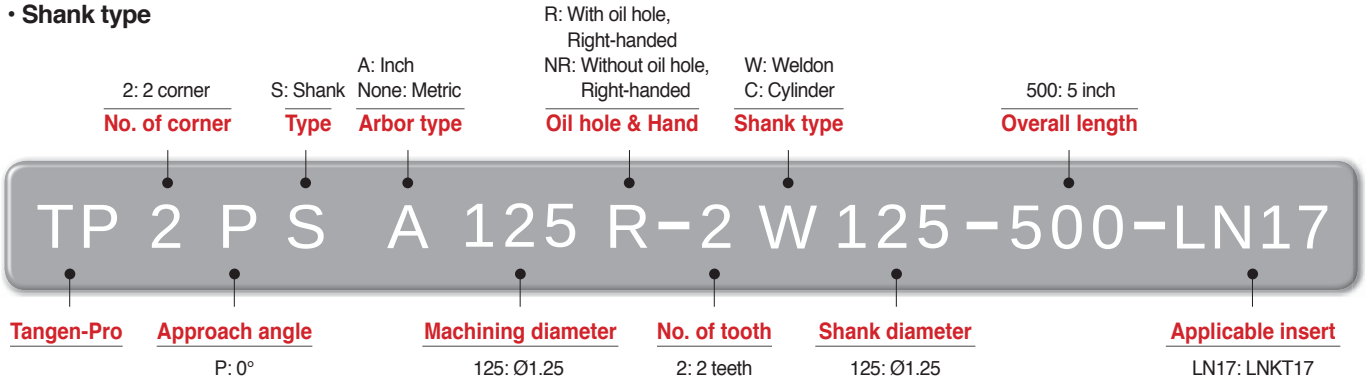

- Clamping stability gained through tangential clamping system and wedge-shaped inserts
- Excellent surface finish nearly perfect perpendicularity, and highly even flank surface compared to competitors' designs
- Improved productivity due to High-rake angles and sharp cutting-edges which lead to lower cutting resistance → Ideally suited for high speed and high feed machining

Code system

• Shank type

• Cutter type

Features of insert

1 Wedge type clamping area

- Clamping in wedge form on seats
  → Creates strong clamping force

2 High-rake angle chip breaker

- High-rake angle applied
- Produces smooth chip flow
  → Extended insert life

3 Convex projection

- Improved chip evacuation
- Enhances rigidity

4 Side hole (tangential type)

- Higher clamping stability

5 High-rake angle cutting-edges

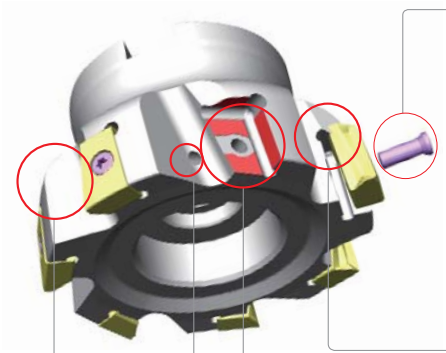

- Improves cutting performance while reducing cutting load

6 2-level flank relief surface

- 1st reverse positive relief surface enhances rigidity
- 2nd negative relief surface enables stable clamping
  → Improved chipping resistance and surface finish

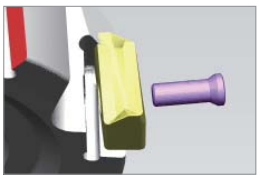

Features of cutter

- Tangential clamping system, wedge-shaped inserts and wide seat area
  → Higher clamping stability
  → Lower vibrations and cutting resistance during machining
- Optimized H/D design with curved surface for smooth chip flow
  → Excellent chip evacuation in ramping or deep shouldering

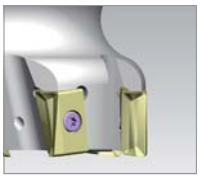

Tangential clamping

- Multi-corner use
  → High feed machining availability

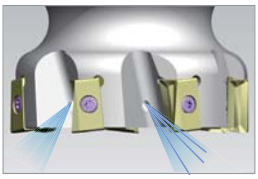

Efficient holder design

- Smoother chip evacuation in slotting or deep shouldering

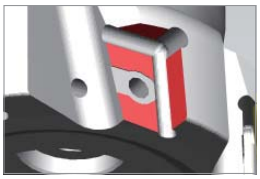

Through coolant system

- Improved chip evacuation
- Longer tool life due to insert cooling

Application guideline per workpiece

Features of KF/KH chip breaker

- KF: Exclusive chip breaker for stable machining of carbon steel with its characteristics of high wear resistance at center part and improved blade design
- KH: Stronger insert with the combination of rake angle and relief angle that are ideal for machining high hardness workpiece

Type	Shape comparison
Standard (For general cutting)	 • Proper to general cutting • Insert shape for uniform performance
KH (For high hardness steel)	 • Center shaper proper for machining high hardness workpiece and uniformed tool life at center part • Improved cutting-edge design by higher rake angle (α°) • Lower relief angle (β°) increases strength of cutting-edges than universal inserts.
KF (For carbon steel)	 • Smaller chisel improves wear resistance at center for machining carbon steel. • Improved cutting-edge design by higher rake angle (α°) • Longer tool life and better cutting performance with the use of excellent blade design

Practical cutting speed calculation formulas

1. Formula of actual diameter

• **Formula**
: Actual diameter

$De = 2\sqrt{ap\,(D - ap)}$

2. θ°Using: Calculating cutting speed at P point
(Cutting speed according to depth of cut when ramping)

• **Formula**
: Practical cutting speed

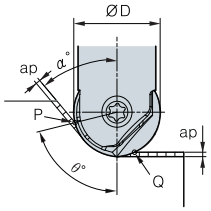

$vce = \frac{\pi\, D \sin\theta \times n}{12}$ (sfm)

$\theta = \cos^{-1}\left(\frac{D - 2ap}{D}\right) + (90 - \alpha°)$

3. In case of using ap: Calculating cutting speed at Q point

• **Formula**
: Pratical cutting speed

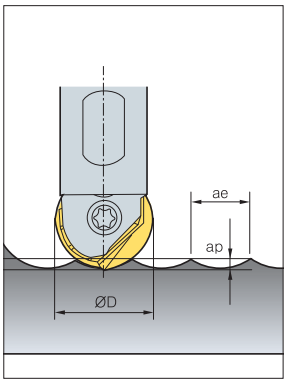

$vce = \frac{2\pi n\sqrt{ap\,(D - ap)}}{12}$

Tangential type (High rigidity)

- Medium/Roughing
- Excellent performance at medium to roughing range (0.551~1.181 inch) table operation due to the strong rigidity of the cutter
- Good performance in heavy interruption and deep depth of cut application

Radial type (Low cutting load)

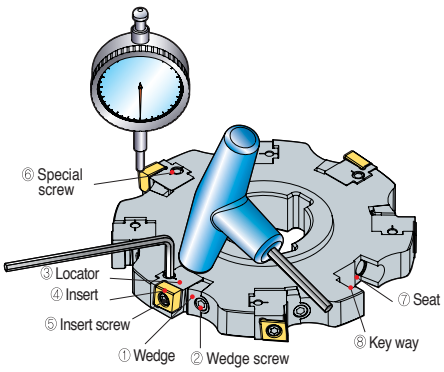

- Medium/Finishing
- Suitable for small width cutting operation (0.472~0.945 inch)
- 3 dimensional chip breaker provides smooth cutting operation
- Several chip breakers as per applications are available (MF, MM, FA)
- Economical insert using 4 cutting-edges per insert

Insert features

- Precise adjustable side cutter can control the width of the cutter by 5 ㎛ unit
- Since the width of the cutter is adjustable up to ±0.06 inch, single cutter can cover various cutting width
- Specially designed clamping system of the locator provides excellent rigidity by using elastic deformation of the locator
- Tangential type clamping system of insert provides enough strength can withstand large width cutting operations
- 3-dimensional chip breaker of insert provides smooth cutting with low cutting load at medium to finishing range

Operating manual

• How to assemble the adjusting side cutter

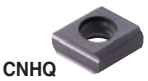

1. Clamp ①wedge slightly on ⑦locator-wedge pocket by using ②wedge screw
2. Put ③locator on ⑦locator-wedge pocket along with the ⑧key-way
3. Tighten the ⑥taper screw little bit to set proper position of locator
4. Tighten the ②wedge screw tightly by using 70~80N.m torque
5. After, put the ④insert on insert pocket of ③locator, clamp it with ⑤insert screw by using 40~50N.m torque

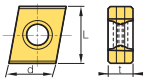

• How to adjust Run-out & cutting width

1. Settle the adjusting side cutter after cleaning to the jig for measurement
2. Un-screw the ②Wedge screw first, then tighten ①wedge slightly again by using 8N.m torque
3. Adjusting the height of cutting-edge by using a dial gauge to set the width of the cutter
4. Tighten the ②wedge screw tightly by using 70~80N.m torque
5. To finish the setting, tighten the ⑥taper screw for strong clamp

High feed cutter with extra pitch for cast iron and light alloy steels

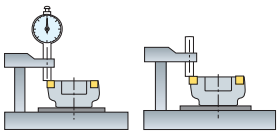

High feed Cutter

- High feed cutter employs extra pitch for cast iron and light alloy steels
- Quick change type for reduction of cutter change time
- Cutting-edge chatter is controlled
- Quick change type for cutter size under Ø6.0, 2 piece types for cutter size over Ø8.0

Guide of insert setting

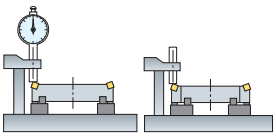

• Special equipment has to be used to get precise run out with high feed cutter.

Adaptor type

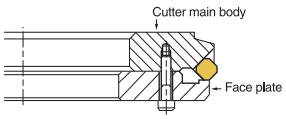

- Mainly under Ø6.0 diameter is used in 1 piece type
- Available for fixed size of cutter and assembling & checking can be done at the same time

Roller type

- Mainly over Ø8.0 diameter is used in 2 piece type
- Due to 3 adjustable guide rollers, variety size of cutter can be assembled

Plate type

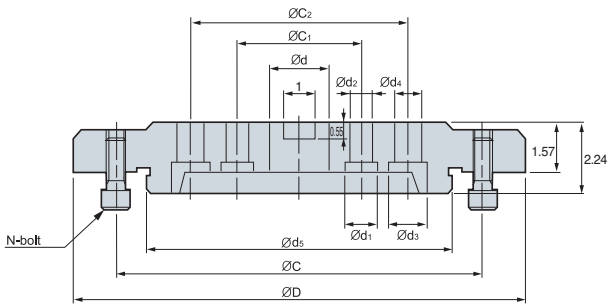

- Suitable for small size cutter due to the simple structure
- It is unnecessary to unclamp the cutter from the machine, it's possible to reassemble the cutter as it mounted on the machine
- You should make plate by yourself

• Guide of insert setting in adaptor/roller type

1. Clean the cutter and equipment
2. Pointer should be assembled with same height with cutter
3. Move to each insert on tip seat to end of pointer and tighten (torque 2 N.m) wedge
4. Exchange pointer to dial gauge
5. Measure the run-out totally
6. When a insert over run-out, loosen wedge and adjust run-out. (for roughing 10~20 μ, for finishing 5~10 μ)
7. Tighten (torque 7-8 N.m) wedge
8. Measure the final run-out by dial gauge

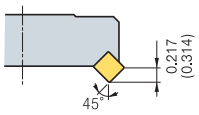

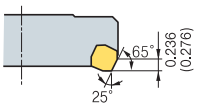

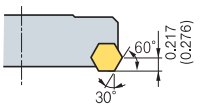

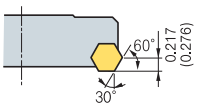

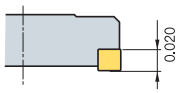

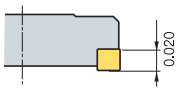

Note: When you clamp wedge too tightly, run-out will get worse due to cutter distortion.
When you clamp the wedge, use torque wrench to set precisely.

Cutting condition by overhang

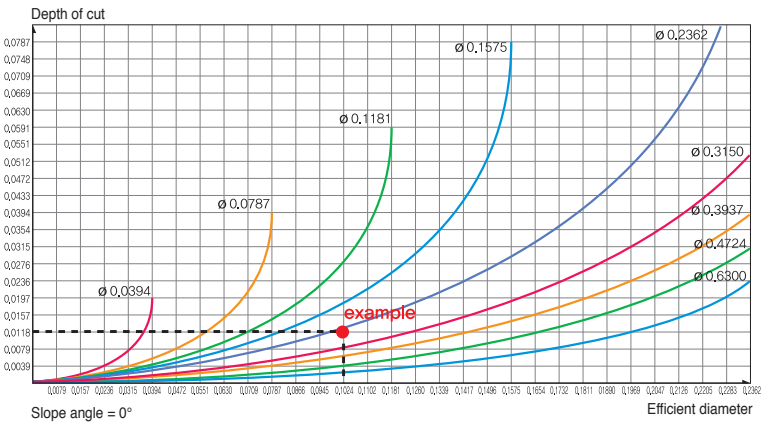

- For shank taper type, Cutting conditions are based on the case of being clamped at neck part
  - When the overhang is increased by 1D in comparion to the overhang, decrease R.P.M and feed by 10%
- In case of the straight type adjust conditions according to the overhang
  - Ex: When the overhang is 3D and is increased by 1D, decrease R.P.M and feed by 10%

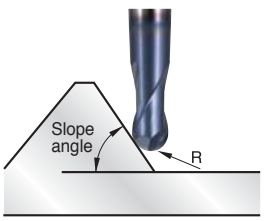

Cutting speed formulas (Ball endmills)

- Efficient cutting speed Veff = (π × Deff × n)/1000 (n = min^{-1})
- Efficient diameter Deff calculation formula Deff = ($2\sqrt{ap(D-ap)} \times \alpha$)
  D = Ø (Tool diameter), Deff = Efficient diameter
- Efficient cutting speed formulas: When slope Ø is 0° Veff = (π × Deff × n)/1000
  Deff = Efficient, diameter Calculate Deff as ap with various ball endmills

α:
α = 1	Slope angle θ = 0°
α = 1.2	Slope angle θ = 7°
α = 1.5	Slope angle θ = 15°
α = 1.7	Slope angle θ = 30°
α = 2.17	Slope angle θ = 45°
α = 2.3	Slope angle θ = 60°

Cutting speed formulas (Ball endmills, slope angle = 0°)

Ex) **Diameter**: 0.236 inch, ap = 0.0118 inch,
Deff = 0.1 inch, N = 14,000 (min^{-1})
Slope angle 0°: Veff = 373 (sfm)
Slope angle 15°: Veff = 373 x 1.5 = 559.5 (sfm)

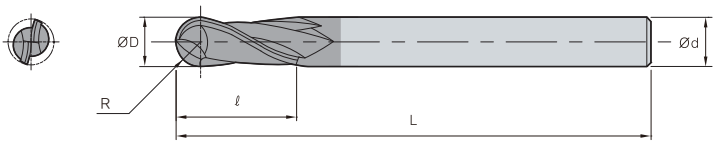

Notice

- Cutting conditions are up to the machine's condition and the shape of cutting
- Use cutting fluid that is proper to the workpiece and produces few temperature reactions

Notice

- Cutting conditions are up to the machine's condition and the shape of cutting
- Use cutting fluid that is proper to the workpiece and produces few temperature reactions

M This is metric size. We can also provide in inch type

Good chip evacuation and fine resistance for built up edge

Solid Endmills for Aluminum

- Good surface finish with miinimized cutting load and built-up edge occurrence
- DLC coating
  - Higher hardness (Hv3000-7000), About 3 to 6 times longer tool life comparing uncoated endmill
  - Fine surface roughness on workpiece with excellent lubricative effect by low friction co-efficient (u < 0.1)
- Superior in Aluminum, Aluminum alloys, Copper and Copper alloys

Features of copper & aluminum machining

- Built-up edge is easily generated though the workpiece has low cutting resistance and chip-removal is fine
- As it has high coefficient of thermal expansion, deflection degree due to machining heat is huge, and it also influences to workpiece quality and residual stress
- While machining, chips can easily damage on the workpiece's surface as the workpice has low hardness, and tool life is over due to flank wear in general

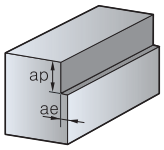

Trouble shooting for copper & aluminum machining

- Use a higher rake angled tool with sharper edges, and minimizes cutting load and built-up edge generating by using oil (MQL) mist
- Increase Vc and reduce the depth of cut for a better surface finish and productivity

Application tip

■ **Shouldering depth (ap) and radial depth (ae)**

- Normal steel, Alloy steel, Stainless steel: ap = 1.5D, ae = 0.1D
- Titanium alloy, Inconel, Hardened steel: ap = 1.5D, ae = 0.05D

■ **Slotting depth (ap)**

- Normal steel, Alloy steel: ap = 1.0D
- Stainless steel: ap = 0.3D
- Titanium alloy, Inconel, Hardened steel: ap = 0.2D

Stainless steel machining

- Low thermal conductivity of stainless steel alloy causes conducting heat to the tool and fracture and chipping
- Stainless steel alloy has high cutting resistance, and it easily causes wear on tools
- High temperature in stainless steel alloy machining lowers cutting conditions and decrease the quality of surface roughness

Trouble shooting for stainless steel

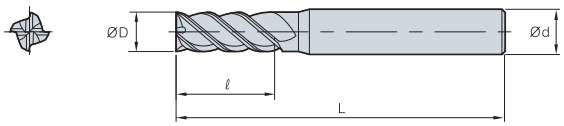

- Getting low cutting conditions
- Getting deeper ap than the work hardened layer and use tools with sharp cutting edge
- Use coolant

High precision machining with our high stiffness design

Brazed Endmills

- Applicable for high speed machining as it reduced frictional resistance while improving its wear resistance by implementing exlcusive substrate and PVD coating
- Long tool life due to absorbing impact through brazed body in heavy interruption
- General steel, Alloy steel, mild steel, dice steel, stainless steel, cast iron, ductile cast iron
- ZSEA: Aluminum, Aluminum alloy, Copper, Copper alloy, Non-ferrous materials
- Coating brazed endmills (special) – Guaranteed long tool life due to high new-concept hardness and oxidation resistant coating

- In case of interrupted machining, reduce the feed to 0.004~0.006 around the interrupted part
- In case of 10D ~12D, follow the recommended cutting conditions below.
- In case of stainless steel machining, machine under low feed first then, set the best cutting condition checking machinability gradually

How to make good insert clamping

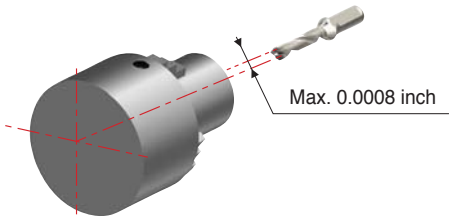

① Clean the mounting seat with air or cloth

② Put an insert on the holder

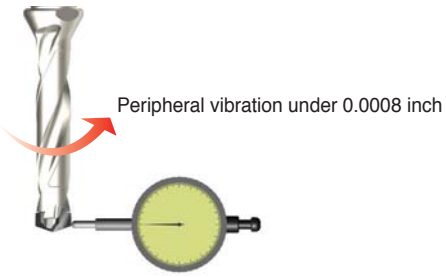

③ A part of wrench and B part of insert must be parallel to each other before clamp the insert
Turn the wrench clockwise to finish clamping

Clamped state

Precautions when setting

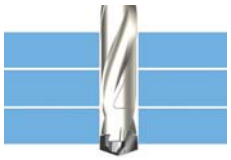

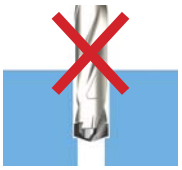

Setting of the horizontal equipment

Setting of the vertical equipment

Precautions when drilling

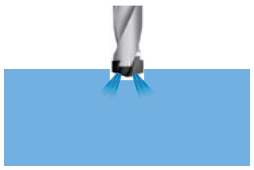

Ramping	Overlapped	Plunging	Boring
			
1. A slope inclined more than 6° is not allowed 2. When entering, reduce the feed to 30~50%	1. Space between panels affects chip evacuation problem 2. Do not make space between panels	Not allowed	Not allowed

Recommended cutting conditions in deep hole (10D, 12D) drilling

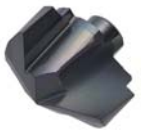

• **Drill with a pilot drill (recommended)**

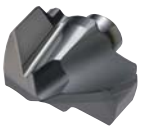

1. Drill a beginning hole (with a pilot drill)	2. Start drilling
	
Drill a beginning hole to the depth of 0.5D and 70% less cutting speed using a 1.5D or a 3D drill.	After replacing the drill to a new one, start drilling under the recommended cutting conditions.

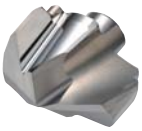

• **Drilling without a pilot drill**

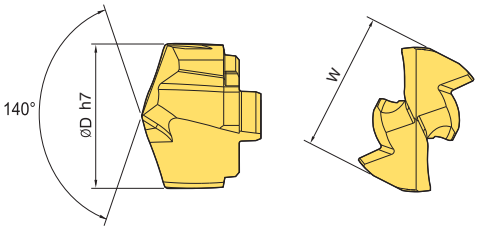

1. Drill a beginning hole (without a pilot drill)	2. Stop drilling	3. Ready for drilling	4. Start drilling
			
After drilling to the depth of 0.5D with 70% less cutting speed, stop drilling for 2~3 seconds without taking out the drill.	After taking out the drill without the injection of the coolant to the hole, stop machining for 2~3 seconds.	Insert the drill to the depth of 0.079~0.119 mm higher than the surface of the bottom of the hole and be ready to machine during 2~3 seconds after starting the injection of the coolant.	Start drilling under the recommended cutting conditions

How to clamp a TPDB-H insert

Clamping an insert to a holder

❶ Put an insert on the tip seat of the holder
❷ As the [pic.1], push the insert to the v-shaped groove of the holder
❸ Screw and clamp the insert

Changing the used insert to a new one

❶ Unscrew and separate the used insert from the holder
❷ As the [Pic.2], clean the insert seat
❸ Put a new insert on the tip seat
❹ As the [pic.3], clamp the insert pushing it with a hand not to separate from the holder

Precaution in drilling

Drilling of angled entrace

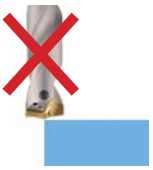

1. The approach angle between drill and the workpiece at the beginning should be less than 6°
2. Reduce the feed to 30~50% than general cutting conditions at the beginning and the end of angled surface.

Drilling of stacked plates

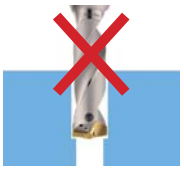

1. Gap between the plates could make wrong chip evacuation causing fracture of the drill.
2. Place stacked plates without any gap between each

Plunging

1. Irregular cutting resistance in plunging could cause fracture and deformation of the drill.

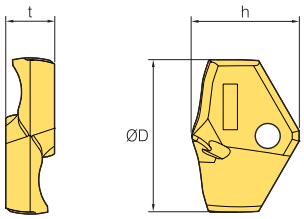

Boring

1. Boring is not recommended due to wear and chipping in the corner of the insert.

How to clamp the drills

Feature of corn-point system

- Convenient and quick adjustable heights when inserting the center drill
- In case the center drill brakes while in usage, it can be replaced with the bolt for adjusting cone point
- The bolt for adjusting cone point prevents chattering on the center drill

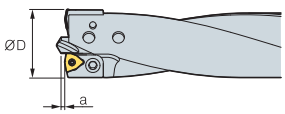

Clamping

❶	❷	❸	❹	❺
				
Place a center drill	Clamp insert and cartridge	Adjust the center drill with the bolt for adjusting cone point	Clamp the center drill firmly with fixing bolt	Reassure the clamp with bolt for adjusting cone point

※ Use safety covers for your safety when clamping the center drill and insert
※ When machining, be careful of the drill disk

Length of the 'a' part of center drill

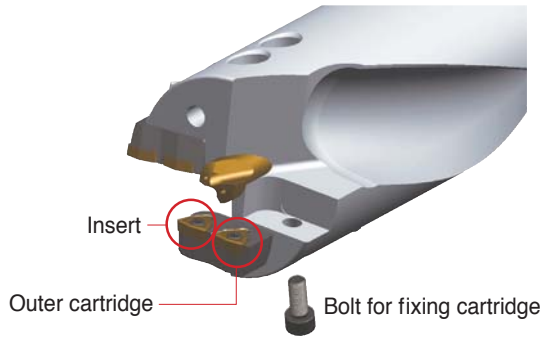

The length of 'a' being too short can cause bad surface finish or high cutting load
On the other hand, the length of 'a' being too long can make tool failure and chattering while drilling

Adjusting diameter of cartridge type drill

- Disassemble a cartridge from the holder by loosening the bolt fixed for outer cartridge
- Machine after calculating the hole size on the side of the outer cartridge
- Trim the sharp part after machining
- Clamp the bolt for fixing cartridge without any gap in between the holder and the machined outer cartridge

- **Range of adjustable drill diameter**
  1. Single cartridge type (Drill diameter Ø1.625~Ø2.313) ⋯› 0.039 inch
  2. Dual cartridge type (Drill diameter Ø2.380~Ø3.310) ⋯› 0.197 inch

- **Diameter of the standard drills is provided with maximum size of standards**

Features

Cutting edge and flute shape

- Straight cutting edge provides better rigidity
- Excellent chip evacuation due to wider chip pocket and improved flute surface roughness
- Double margin secures machining stability

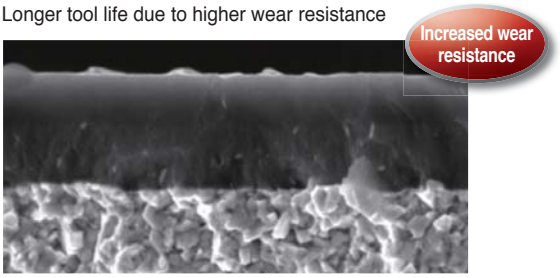

Cutting edge shape

New grade (PC315G)

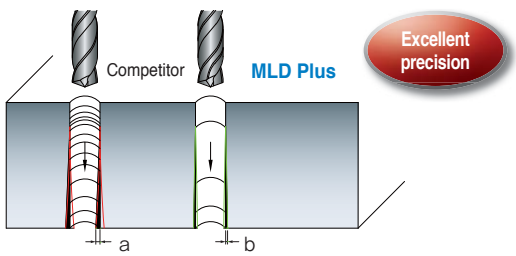

- Ultra-fine substrate and new coating applied
- Lubricative coating layer improves chip evacuation with lower frictional resistance
- Longer tool life due to higher wear resistance

PC315G

Machining accuracy

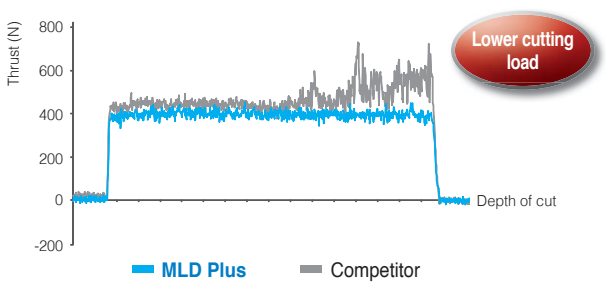

- Improved machining precision
  - Bent holes reduced, Inside hole surface roughness improved
  - Hole size uniformity increased
- Improved point shape
  - Precise location secured

Reduced bent holes compared to competitors (a > b)

High feed and precision machining with our specially designed point edge

Vulcan Drill

- High feed and precision machining due to specially designed point edge
- Vulcan drills ensure longer tool life under high speed condition because of increased thermal & wear resistance. It also uses a PVD coating with an exclusive substrate to help maintain reduced frictional resistance
- Low cutting resistance by the best design of clearance angle is possible to increase feed
- Smoother chip control due to improved chip breakage
- Rmax: 6~25s, Hole tolerance: IT8 ~ 10
- Strong shock resistance ensures long tool life under the heavy interrupted machining

Code system

Application for vulcan drill

- General steel, Alloy steel, Mild steel, Dice steel, Stainless steel, Cast iron, Ductile cast iron, Non-ferrous metal, etc

Notice

- **Unsuitable drilling**
  - Avoid the inclination or unevenness of entering and piercing section of hole as possible
  - Reduce the feed 0.1~0.15 mm/rev when drilling at inclined and unevenness
- **Clamping of workpiece**
  - In case of wide flat panel or rotation by horizontal component, please clamp to be prevented bending of central part of workpiece for high efficiency

Application of Gun Drill on exclusive machine

• The guide bush is necessary for centering before gun-drilling

Application of Gun Drill on machining center

1 Machining of a pilot hole

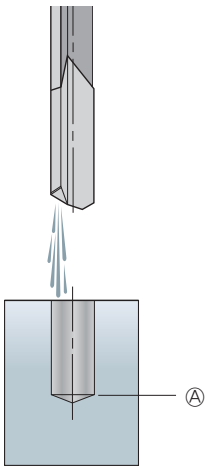

1. A pilot hole is necessary in machining on a machining center instead of a guide bush
2. The diameter of the pilot hole should be 0.004~0.008 (H7) larger bigger than one of the Gun Drill diameter and the depth of drilling should be about 0.098×D
3. Use Mach Drill (MSD) for machining of a pilot hole

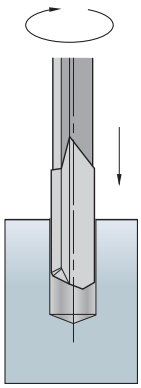

MSD

2 Moving the Gun Drill to the pilot hole

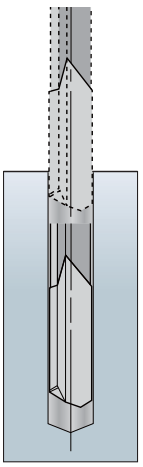

1. The Gun Drill should not drill before entering the pilot hole
2. Coolant is necessary for gun drilling

3 Start Gun Drilling

1. Rotate the spindle
2. Machine with drilling to vertical axis

4 After Gun Drilling

1. Return the drill
2. Stop drilling and supplying coolant
3. Remove the Gun Drill

Technical information

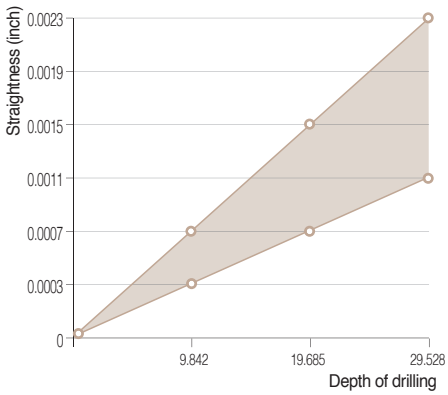

The factors below determine the straightness of hole

• Drill diameter and depth of drilling • Cutting condition and kind of application • Kind of workpiece and machine • Drill bush

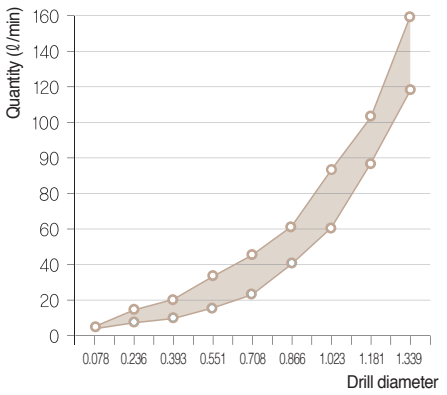

Required machine power

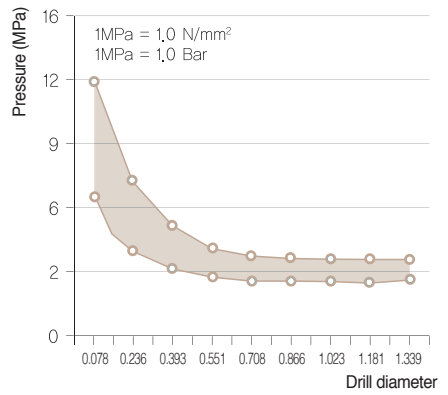

Straightness

Quantity of coolant

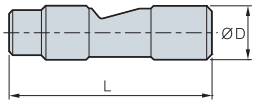

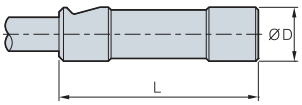

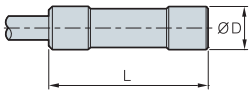

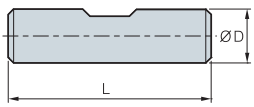

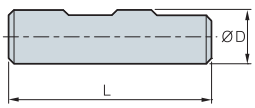

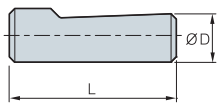

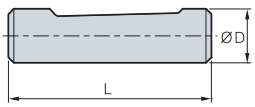

Pressure of coolant

The above graph shows general information and it is changeable depending on kind of tool, workpieces, and cutting conditions etc

- **Pressure and quantity of coolant** - High pressure of coolant ensures excellent chip evacuation and cooling the cutting edge
- **Use a filter for removing impurities** - The diameter of a filter should be less than 20㎛. Impurities could make bad flow of coolant, wear on a tool, and high load on the cooling pump
- **Temperature of coolant** - Proper temperature of coolant: 20°C~22°C/Do not use coolant at 50°C above

Application

Throughout hole machining (IRT type)

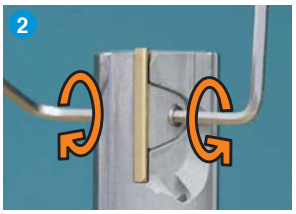

Stuffed hole machining (IRB type)

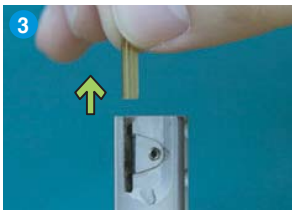

How to set an insert

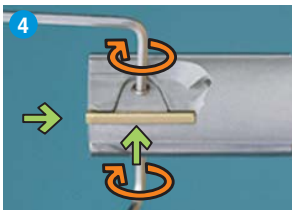

1. Screw the wedge screw counter clockwise with the exclusive wrench

2. Screw the clamp screw
   ① Top side: counter clockwise
   ② Lower side: clockwise

3. Remove the insert and clean the pocket

4. Put the insert up to the edge stopper and clamp the insert
   ① Top side: clockwise
   ② Lower side: counterclockwise

Exclusive fixture

- Designation: KIRSD-210
- Maximum diameter of reamer: Ø2.36×8.27 inch
- The fixture is also available for setting special reamer and mono tool
- Special reamers (out of maximum setting range) are available quotation

How to set an insert with fixture

1. Adjust the gauge to '0'

2. Rotate the reamer for the insert to touch the gauge

3. Set the back taper and adjust the insert height with screw the wedge screw
   ① Top side of insert: +0.0059~ +0.0078 inch
   ② Bottom side of insert: +0.0019~ +0.0039 inch
   ③ Back taper: 0.0039~0.0059 inch

Back taper

- Ensures low cutting load and excellent surface finish with good chip evacuation
- Inaccurate back taper could cause unstable machining with wear of insert
- The size of back taper of insert down side should be less to 0.0039~0.0059 inch than one of insert upper side

Insert setting with a micrometer

- Lathe with both centers or bench center are also available

Notice: The setting with a micrometer is not recommended due to chipping on the cutting edge

KORLOY ultra-fine grades “F-Series”

Features

In general, when we compare cemented carbide to high speed steel, cemented carbide has higher hardness but is more brittle than high speed steel. To neutralize the difference, KORLOY has developed an ultra fine cemented carbide grade “F-Series”± (WC size under 0.5㎛). It provides improved toughness and plastic deformation resistance against cemented carbide having coarse grain sizes. The main coverage for ultra fine cemented carbide is endmilling of difficult-to-cut materials like high temp alloys

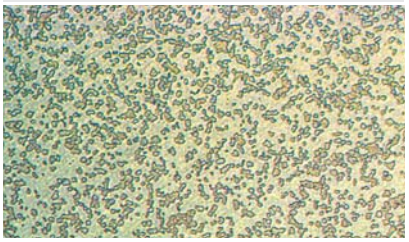

● Micro structure of “F-Series”

FA1

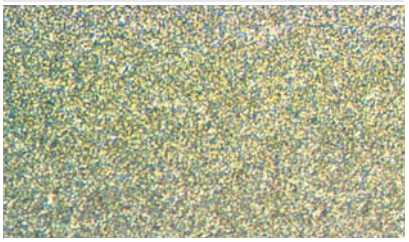

Since it is a grade focused on toughness, it is possible to make endmill, side cutter, gun drill, reamer etc. It has superior quality on toughness and anti built-up edge properties

FCC

It has been modified from FA1 to increase thermal shock resistance, thus FCC has proper properties to machine stainless steel and hard to machine materials at medium to high speed milling

FS1

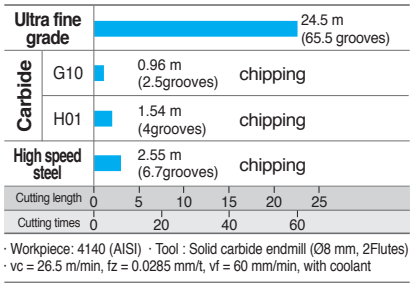

As a ultra fine grade having high hardness and superior toughness at the same time, it is the 1st recommended grade of KORLOY to make sharp cutting edge to cut difficult-to-cut material

For high speed machining

DBT Series

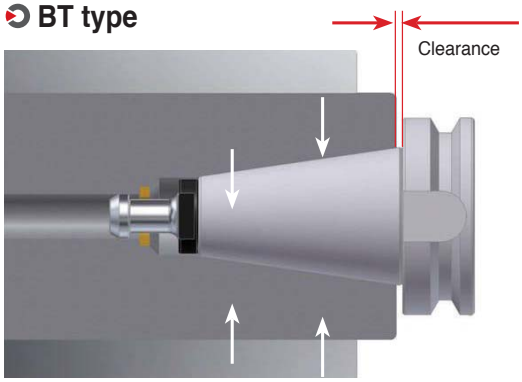

2 face constrained system of taper and shank face for excellent surface roughness and high quality finish in heavy cutting at high speed

Features of 2 face constrained system

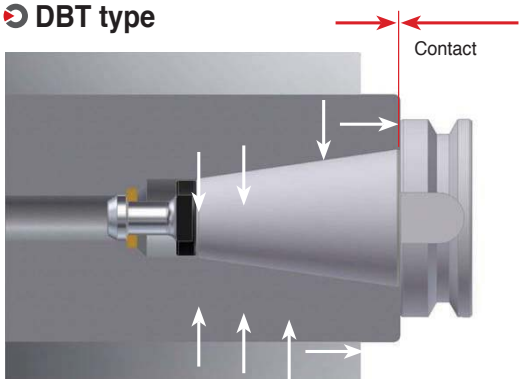

- Stable machining can be possible at high speed
- Improvement of tool-life for machine spindle and cutting tool
- Prevention for corrosion of taper porsion of both machine spindle and tool holder by heavy duty machining vibration
- Guarantee for the most suitable machining and high accuracy

BT type

The clearance between spindle and face of shank

DBT type

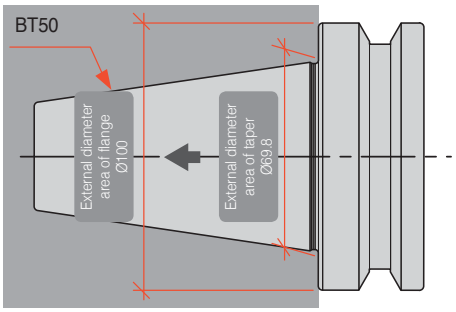

Perfect contact of both faces Better precision/less vibration

Higher stability and precision

Stability and precision increase due to the close contact between taper face and wide external diameter of flange at DBT shank than at BT shank

HSK Tooling System

Features of HSK 2 face constrained toolholder

The 7/24 taper shank for multi-purpose has been pointed out that its performance is inappropriate in terms of repeatability, joint stiffness and high speed machining. Drawbacks of 7/24 taper shank had been eliminated by using new two face contact

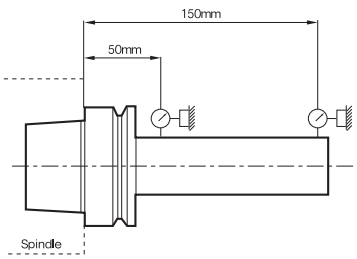

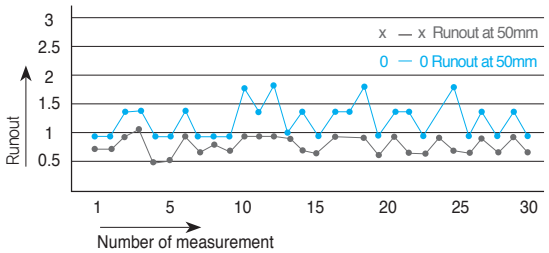

HSK shank -Perfect 2-surface constrained system

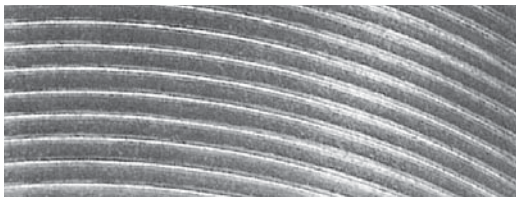

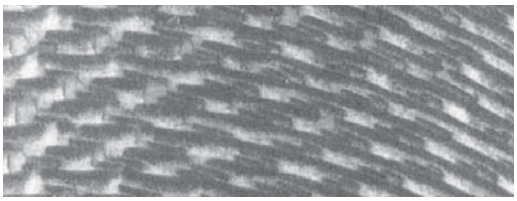

Excellent repeatability-run out accuracy

As taper of holder will deform elastically following the profile of the spindle shape, there is no eccentricity between the spindle and the other. Also, due to perfect face contact between flange surface of the holder and spindle face, bending strength of the holder is very high, which makes radial and axial and accuracy very high

High rigidity against bending load

Balancing System

Imbalance

- **Cause of imbalance**
  Imbalance occurs due to the asymmetry of tool geometries and spindle run-out
- **Difficulties of imbalance**
  Shorter tool life, inferior surface roughness and noise are caused by vibration during rotation and damage on spindle bearing
- **Need for balancing**
  Balancing is needed to prevent unbalance for better surface roughness, precision and tool life

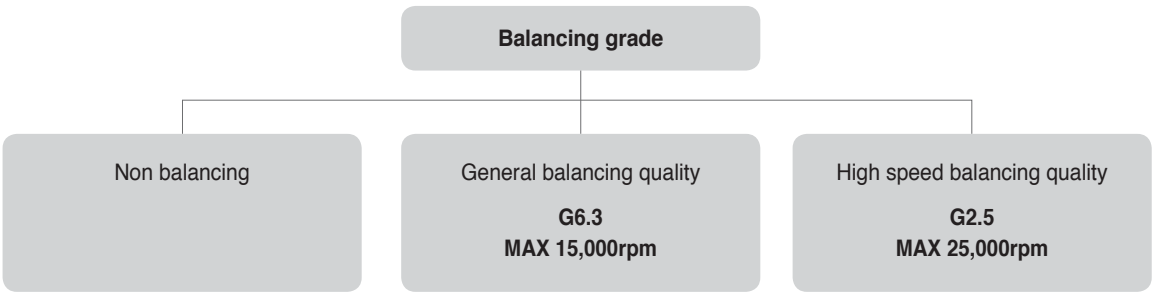

※ A case that the tool's center of gravity deviates from the rotation axis

The most optimal accuracy at high speed

- Without bending from rotation of an unbalanced load, High accuracy and rigidity are maintained
- Excellent Balance (≤ G1.0 or 0.5 g·mm/kg)
- Tool life, surface finish, dimension of accuracy and productivity can be realized at high speed

GER Collet_GER

GERC new

- Corrosion resistant collet to micro unit
- High tech coating for long lasting precision
- Longer tool life and higher productivity

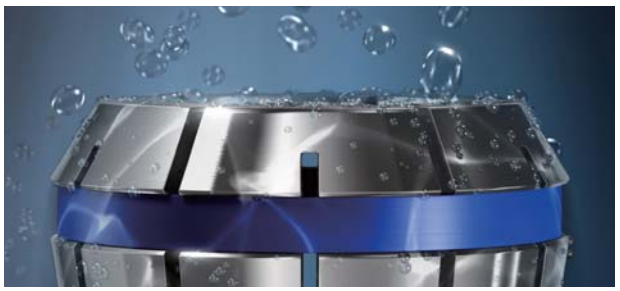

Code system

GERC - 16 6.0 - HP

- GERC: Spindle GER Collet
- 16: Clamping range
- 6.0: HP: Precision / Non: General
- HP: HP: Precision / Non: General

Special coating technology

Unlike GERC collets, Conventional non-coated collets have the following features:
Non-coated collets are affected by corrosion due to high humidity, cutting fluid, cleaner, salt, gas and many other factors, which in result deteriorates whole quality of machining

When a collet gets rusty, the tool life is shortened and precision considerably decreases. To prevent this problem, surface treatment by micro unit was applied to GERC collets for effective protection and long lasting precision

GERC Competitor

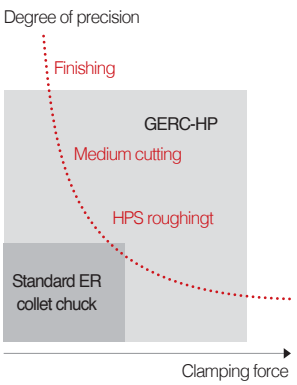

Two samples of collets after 4 months of use:
Left: GERC collet, Right: Non-coated

GERC-HP

A precision type collet chuck is expensive than standard one, but still it has more advantages in long term cost and efficiency. Using GERC-HP can minimize pricy reworking due to smaller tolerance with maximum precision

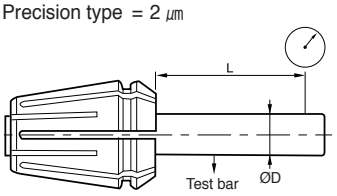

Precision type collet 2 ㎛

Precision (L/D = 3)

Standard type = 5 ㎛
Precision type = 2 ㎛

- Mirror surface and high rake angle of insert provides excellent machined surface by reduced cutting load and edge build-up
- Grade: H01

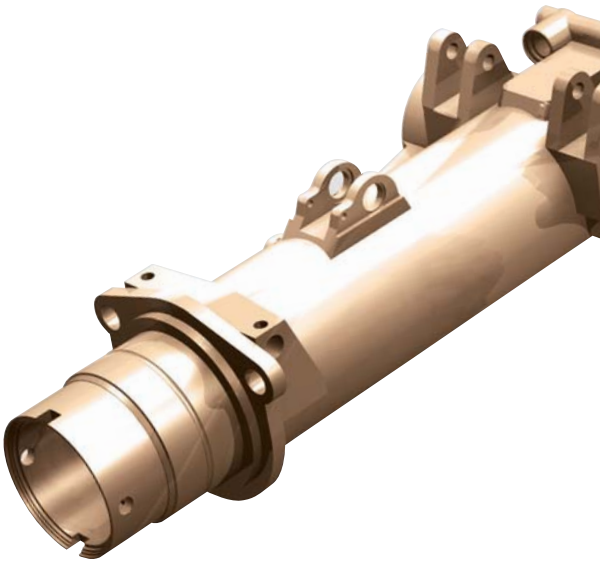

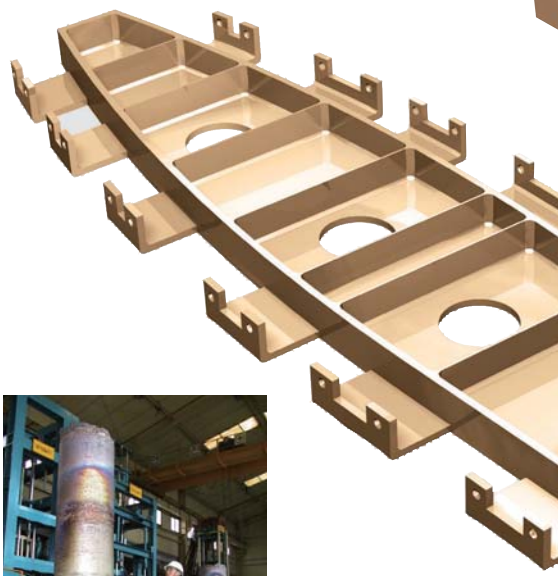

SSEA

Solid carbide end-mill for aluminum machining

- Advanced geometry of end-mill refrains build-up-edge
- Superior surface machined
- DLC coated end-mills available

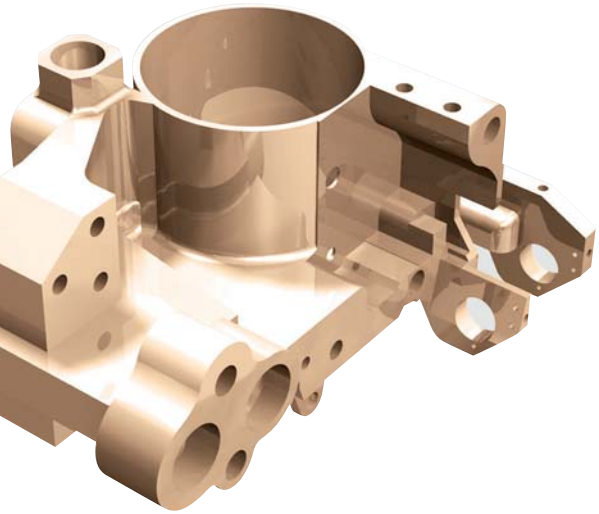

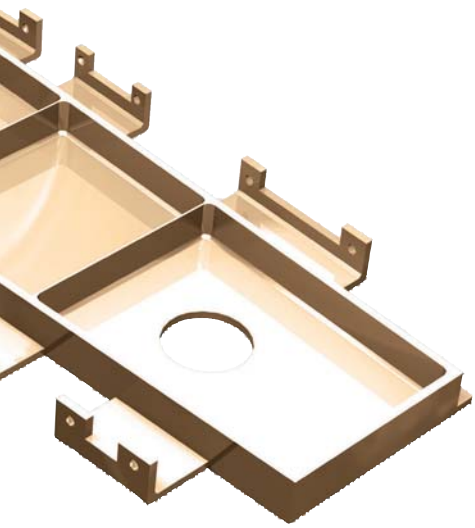

Titanium
Picture provided: KPC Inc

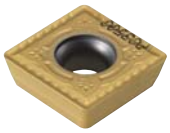

King Drill

Optimal indexable drill design

- Drill shape and chip breaker are optimized at the central and peripheral insert locations for better chip control and surface finish
- Grades, optimized for the central and peripheral insert locations in order to maximize cutting tool life
- Grade: PC3500, PC5300

MLD (Mach Long Drill)

- Direct drilling without separate operation (step drilling) over 20xD
- Wider flute space along with drill provides effective chip control
- Special design for rigid body provides smooth drilling without bending of drill

Alpha Mill

Multi functional milling tool

- Vast coverage of milling operation due to its variety of cutters and inserts
- 3 dimensional chip breaker design provides smooth cutting

Brazed Endmill

- Apply High Spiral Angle (over 40 degrees) able to get good sharpness
- Available high speed milling due to reduce the working temperature
- Expected long tool life by applying hardened carbide material.
- Economical welded tool due to available 2 or 3 times re-grinding

Slitter Knife

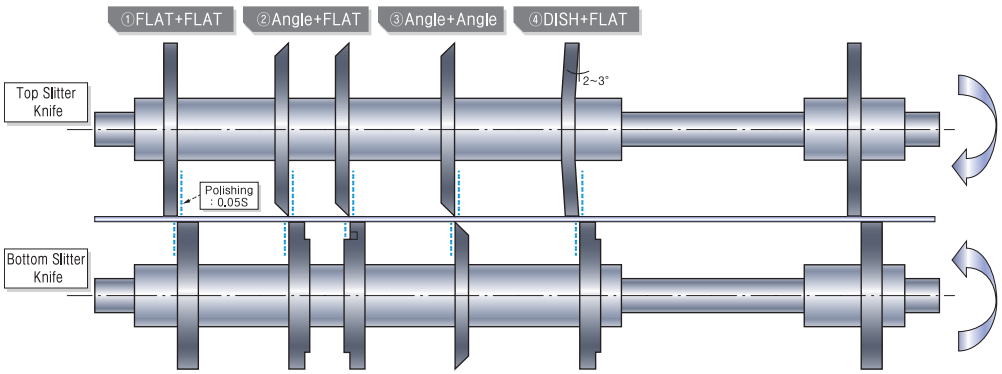

Application

- For video tape/For audio tape
- For mangetic tape/For brass plate, mobile battery

Tool selection

- Top slitter knife: Thickness: ±0.00039~0.00078 inch
- Bottom slitter knife: Thickness: ±0.00004 inch / Flatness: under 0.00002 inch
  Polishing surface roughness: under 0.05 S

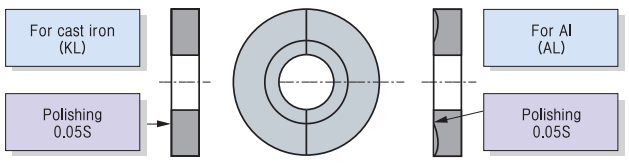

Machining example

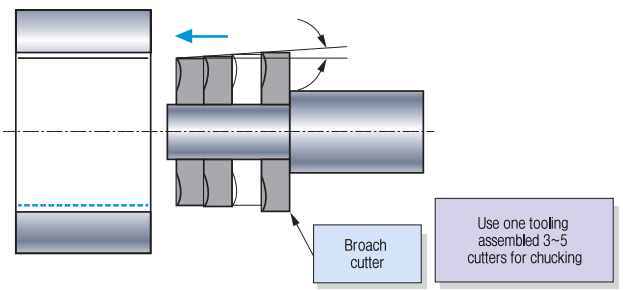

Broach cutter

Application

- Broach cutters apply to inner machining of metal bearing which is used for automobile crank shaft

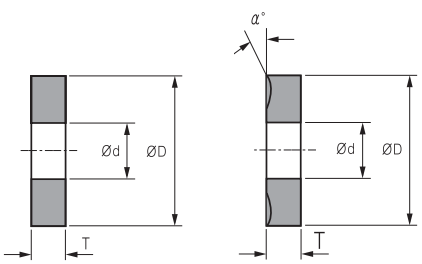

Order

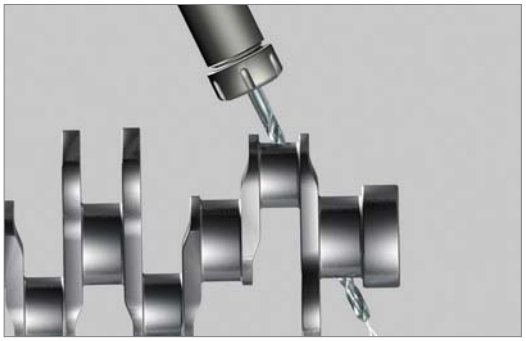

- Designation for cast iron: KL Ød×Ød×T
- Designation for Aluminium: AL Ød×Ød×T
  : AL Ød×Ød×T×α°

(If there is no mentioned any angle, α = 30°)

The affects of cutting condition

- The most desirable machining means short machining time, long tool life and good precision
  This is the reason that proper cutting condition for each tools should be selected according to material's properties, hardness, shapes, the efficiency of machine

Cutting speed

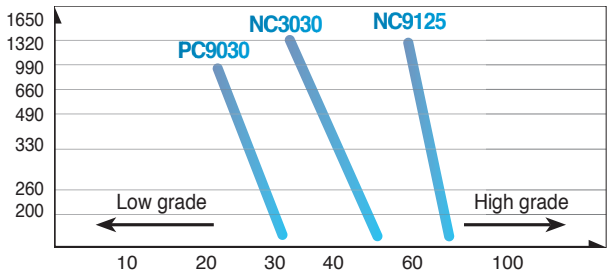

- **Workpiece:** S45C (180HB)

- **Depth of cut:** 0.060 inch
- **Feed:** 0.012 ipr

- **Insert:** CNMG431, Dry cutting

(The tool life feature of P grade)

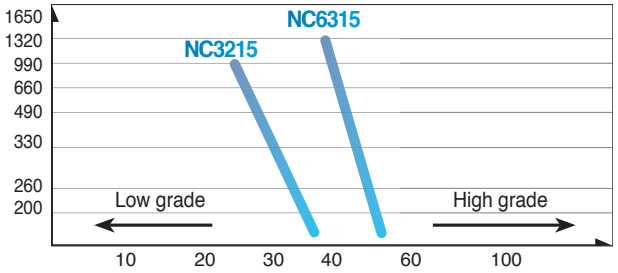

- **Workpiece:** STS304 (200HB)
- **Tool life criterion:** V_B = 0.008 inch
- **Depth of cut:** 0.060 inch
- **Feed:** 0.012 ipr
- **Holder:** PCLNR16-3D
- **Insert:** CNMG431, Dry cutting

(The tool life feature of M grade)

- **Workpiece:** GC300 (180HB)
- **Tool life criterion:** V_B = 0.008 inch
- **Depth of cut:** 0.060 inch
- **Feed:** 0.012 ipr
- **Holder:** PCLNR16-3D
- **Insert:** CNMG431, Dry cutting

(The tool life feature of K grade)

Cutting Speed's effects

- When the cutting speed increases up to 20% in an application, the tool life respectively decreases down 50%
  Although inversely, if the cutting speed increases up to 50% the tool life decreases 20%. On the other hand if cutting speed is too low (66~131 sfm) Tool life shortens due to vibration

Feed

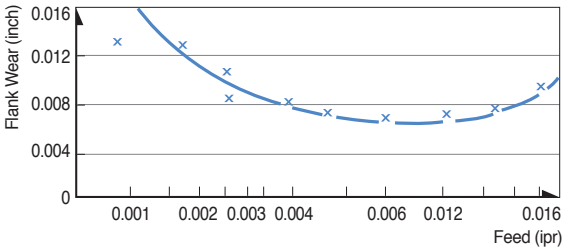

- The feed rate in turning means the progressed interval of a distance in a work piece within 1 revolution
  The feed rate in a milling application means the table feed divided by number of teeth of cutter (feed rate per tooth)

The effects of feed

- When the feed rate decreases the flank wear is increased. When the feed rate is too low, the tool life shortens radically
- When the feed rate increases, the flank wear increases due to high temperatures, however the feed rates effects tool life less than the cutting speed. And higher feed rates improve machining efficiency

(Relationship between feed and flank wear in steel turning)

- **Workpiece:** SNCN431
- **Grade:** ST20
- **Cutting speed:** 656 sfm
- **Depth of cut:** 0.039 inch
- **Cutting time:** 10 min

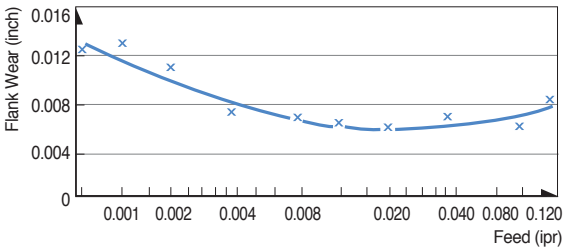

Depth of cut

- Determined by the required allowances in machining a material and the capacity the machine can tolerate
  There are cutting limits according to the different shapes and sizes of the insert

(Relationship between depth of cut and flank wear in steel turning)

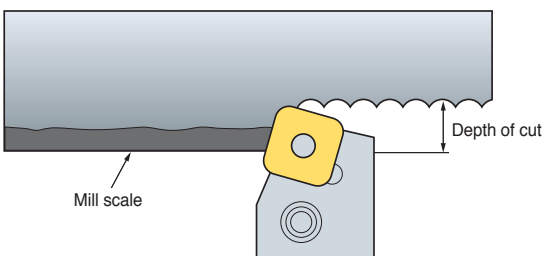

- **Workpiece:** SNCN431
- **Grade:** ST20
- **Cutting speed:** 656 sfm
- **Feed:** 0.008 ipr
- **Cutting time:** 10 min

The effect of a depth of cut

- The depth of cut does not have a big influence on tool life
- When the depth of cut is small the work piece is not cut but rather rubbed. In these cases, machine off the work hardened parts that decrease tool life
- When machining a cast skin or milling scale smaller depth of cuts usually cause chipping and abnormal wear because of hard impurities in the surface of the work piece

(Surface parts including mill scale Roughing)

Relief angle

• Relief angle avoids the friction between workpiece and relief face and makes cutting edge move along workpiece easily

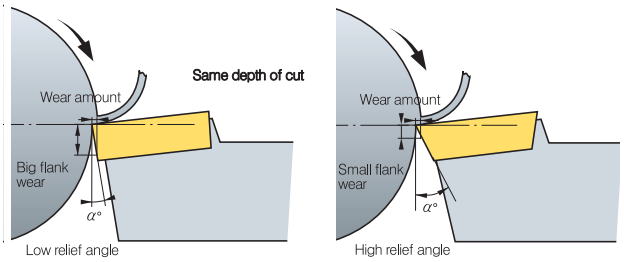

● Relationship between various relief angle and flank wear

Affects

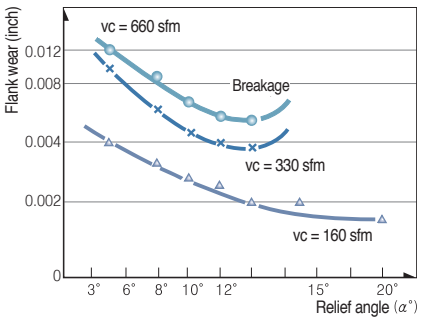

1. If relief angle is big Flank wear decreases
2. If relief angle is big Cutting edge strength weakens
3. If relief angle is small Chattering occurs

Selection system

   - Low relief angle
2. Soft workpiece/Workpiece turning to work hardening easily
   - High relief angle

• **Workpiece:** 4320 (H)
• **Grade:** P20
• **Depth of cut:** 0.04 inch
• **Feed:** 0.013 ipr
• **Cutting time:** 20 min

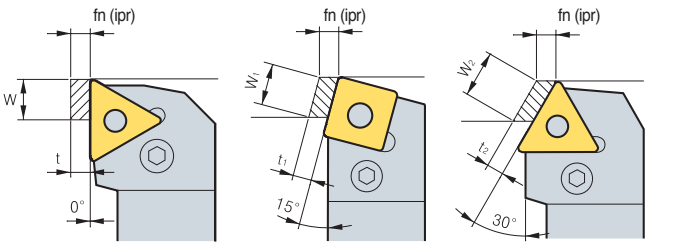

Side cutting edge angle

• Side cutting edge angle has big influence on chip flow and cutting force therefore proper Side cutting edge angle is very important

● Side cutting edge angle and chip thickness

• As side cutting edge angle is getting bigger chips are getting thinner and wider (refer to left picture)
• At the same feed and depth of cut with approach angle 0˚ Chip thickness is the same as feed (t = fn) and chip width is equal to depth of cut (W=ap)

$t_1 = 0.97t$, $W_1 = 1.04W$
$t_2 = 0.87t$, $W_2 = 1.15W$

① Approach angle 0˚　② Approach angle 15˚　③ Approach angle 30˚

● Side cutting edge angle and 3 cutting forces

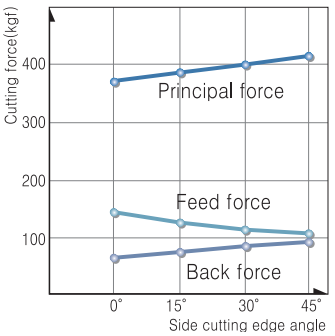

Affects

1. Big side cutting edge angle with the same feed makes chip attaching length longer and chip thickness thinner. So that cutting forces scatter to long cutting edge therefore tool life gets longer
2. Big side cutting edge angle for machining long bars can cause bending

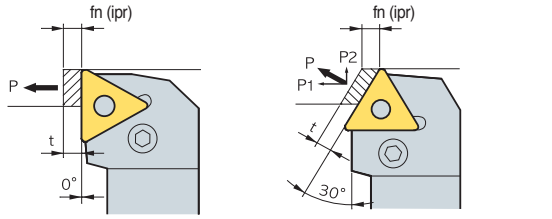

Selection system

1. Deep depth of cut finishing/Long thin workpiece/Low machine rigidity
   - Side cutting edge angle
2. Hard and high calorific power workpiece/Roughing big workpiece/ High machine rigidity - Side cutting edge angle

• **Workpiece :** 4140
• **Grade:** TNGA433

● Side cutting edge angle and cutting load

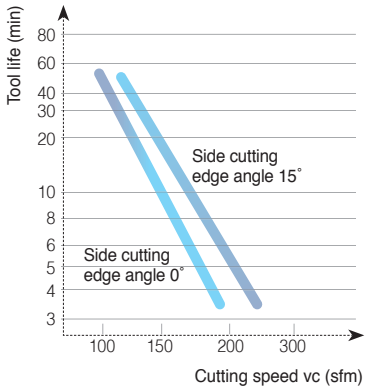

① "Force P is loaded." ② "Force P is scattered to P1, P2."

As approach angle gets bigger Back force gets bigger and feed force gets smaller

● Side cutting edge angle and tool life

- **Workpiece:** 4130
- **Grade:** P20
- **Depth of cut:** 0.12 inch
- **Feed:** 0.008 ipr

● Side cutting edge angle and cutting performance

End cutting edge angle

- It affects machined surface to prevent interference between surface of workpiece and insert

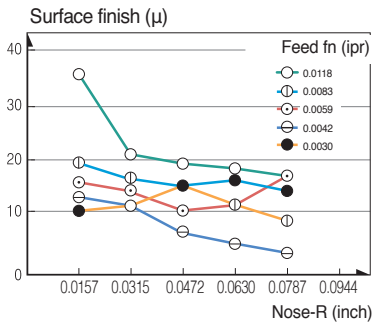

Affects

1. If end cutting edge angle reduces cutting edge get stronger but cutting heat generated by machining increases
2. Small end cutting edge angle can cause chattering due to the increases cutting force

Nose-R

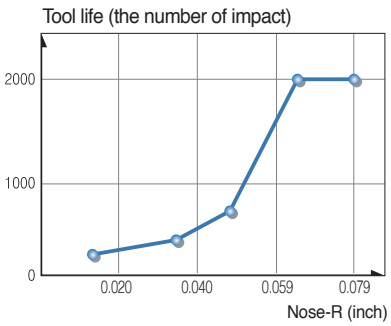

- Nose-R affects not only surface roughness but strength of cutting edge
- In general, It's desirable that Nose-R is 2~3 times bigger than feed

- **Grade:** P10
- **vc:** 460 sfm, **ap:** 0.08 inch
- **fn:** 0.008 ipr, **T:** 10 min

Nose-R

Affects

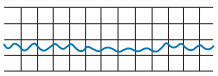

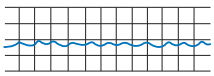

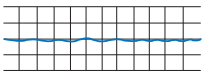

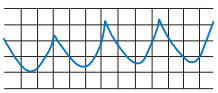

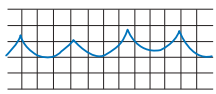

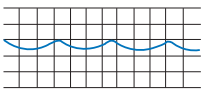

1. Big Nose-R improves surface finish
2. Big Nose-R improves cutting edge strength
3. Big Nose-R reduces flank wear and crater wear
4. Too big Nose-R causes chattering due to increased cutting force

Selection system

0.006			
0.010			
0.018			

Cutting edge shape and the affects

● Rake angle (α)

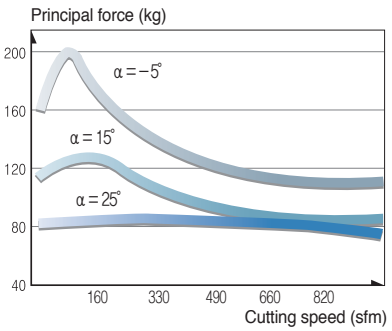

Rake angle has big influence on cutting force, chip flow and tool life

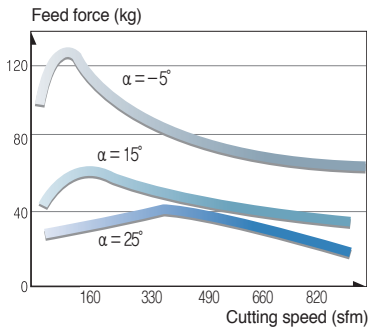

Affects

1. High rake angle results in good suface finish
2. As the rake angle increases by 1° Machining power decreases by 1%.
3. High rake angle weakens cutting edge

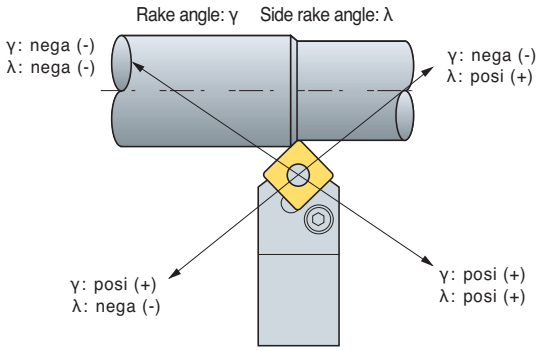

Selection system

1. For hard workpiece/For applications that need strong cutting edge such as interrupted and machining mill scale - Low rake angle
2. For soft workpiece/Easy to cut material/When the rigidity of machine power and workpiece is low - High rake angle

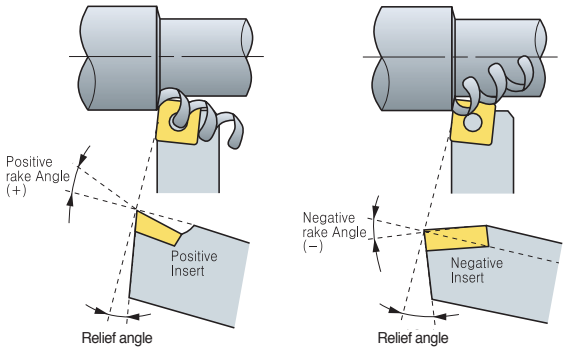

● Rake angle and the direction of chip flow

Disadvantages	• Weak cutting edge strength • Only single sided inserts are available (No economical) • Machine and cutter need enough power and rigidity	• Machine and cutter need enough power and rigidity	• Only single sided inserts are available (No economical)	• Since the chips flows toward the center of cutter. Chips scratch on machined surface • Bad chip flow • No economical

The differences between general endmills and high speed endmills

General endmills		High speed endmills	
Cross section shape	Features	Cross section shape	Features
	- Applied for Low speed, High depth of cut, Low feed - Low hardness workpiece(general steel, cast iron)		- Applied for high speed, low depth of cut, high feed - Useful for hardened workpiece such as die steel

Calculations of cutting condition

● Calculations of Cutting speed

$$vc = \frac{\pi \times D \times n}{12} \qquad n = \frac{12 \times vc}{\pi \times D}$$

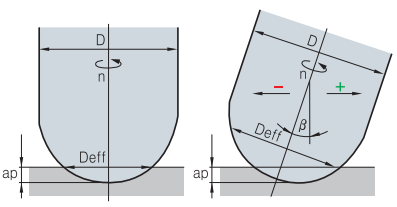

● Calculations of feed speed

$vf = n \times fn$ or $n \times fz \times z$

$$fn = \frac{vf}{n} \qquad fz = \frac{fn}{z} \text{ or } \frac{vf}{n \times z}$$

vc: Cutting speed (sfm)
π: Circular constant (3.141592)
D: Endmill diameter (inch)
n: Revolution per minute (min^{-1})
vf: Feed speed (ipm)
fn: Feed per revolution (ipr)
fz: Feed per flute (ipt)
z: Number of flute

Ball endmills cutting speed calculation formulas

Revolution per minute	$n = \frac{vc \times 12}{D \times \pi}$
Cutting speed	$vc = \frac{D \times \pi \times n}{12}$
Feed per tooth	$fz = \frac{vf}{z \times n}$
Feed per revolution	$fn = fz \times z$
Feed speed	$vf = fz \times z \times n$
Chip removal rate	$Q = ae \times ap \times vf$
Effective diameter of Ball Endmill	$D_{eff} = 2 \times \sqrt{D \times ap - ap^2}$ Calculation Table
	$D_{eff} = D \times \sin\left[\beta \pm \arccos\left(\frac{D-2ap}{D}\right)\right]$

The affection of flute length

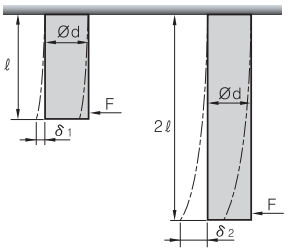

● Expression of aspect ratio

- Aspect ratio
- ℓ/d
- Ex) 3D, 15D, 22D

● Deformation rate according to length

- Deformation rate is reaction force against external force
- Proportional to the cube of length
- Set flute length and overall length as short as possible
- The more flute the better rigidity
- When flute width rate is narrower drill's rigidity is higher

$$\delta = \frac{P\ell^3}{3EI}$$

δ = Deformation volume **ℓ** = Length of cut

P = Cutting force **E** = Elasticity coefficient

I = Inertia moment ($I = \frac{\pi d^4}{64}$)

- ℓ : 2ℓ
- δ1: δ1 = 8δ1 = δ2

The shape of drills and the names

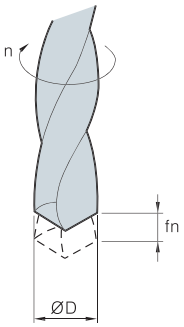

Shape and the feature of cutting

Helix angle	Plays rake angle of cutting edge's role. If helix angle increases Cutting force decreases. On the other hand If helix angle is too big Drill rigidity decreases Poor machinability ◀ low - Helix angle - high ▶ Smooth chip evacuation Hard workpiece (hardened steel) ◀ low - Helix angle - high ▶ Soft material (aluminum etc)
Length of flute	The path of both chip evacuation and cooling lubricant Too big length of flute weakens drill rigidity and too small length of flute worsens chip evacuation to breakage
Point angle	Point angle has big influence on cutting performance. It mainly depends on workpiece. In case of standard drills Point angle is generally 118 thrust resistance decrease ◀ low - Point angle - high ▶ thrust resistance increase Torque increase, Burr on exit increase ◀ low - Point angle - high ▶ Torque decrease, Burr on exit decrease Soft material (aluminum etc) ◀ low - Point angle - high ▶ Hard workpiece (hardened steel)
Margin	While machining Margin is the part of contact between workpiece and drill's external. It prevents bending and plays guide's role It depends on drill size Cutting force decrease ◀ small - Margin - big ▶ Cutting force increase Poor guide ◀ small - Margin - big ▶ Good guide
Web thickness	Web is the part of center of drill and drill's rigidity depends on the web. Drill needs cutting edge, chisel edge, at the tip of drill because drill makes a hole at the beginning of drilling . When web thickness is big Thinning is needed to reduce cutting force Cutting force decrease ◀ small - Web thickness - big ▶ Cutting force increase Rigidity decrease ◀ small - Web thickness - big ▶ Rigidity increase Good chip evacuation ◀ small - Web thickness - big ▶ Bad chip evacuation Soft material (aluminum etc) ◀ small - Web thickness - big ▶ Hard workpiece (hardened steel)
Back taper	Drill diameter size is getting smaller from point to shank in order to avoid the friction between drill periphery and workpiece. The decrease of diameter divided by flute length 100mm generally becomes 0.0015~0.0394 inch. As for high performance drills and drills for hole shrinkage workpiece during operation have big back taper
Thinning	In general drills Thrust effects on chisel over 50%. Chisel edge length depends on web thickness and chisel angle. But if web is thin Drill rigidity weaken. Therefore without web thickness change Thinning makes chisel edge short or gives rake angle. In other words, Thinning makes rake angle at chisel and improves chip evacuation and decrease thrust

Cautions

● Selection of drill chuck

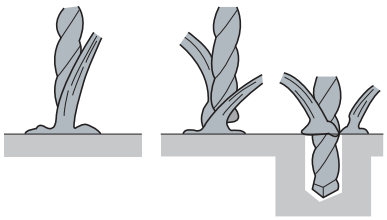

• Collect chuck is favorable Because it has strong grip power
(General drill-chuck and Keyless chuck don't have enough grip power.)

• Collect chuck • General drill-chuck

● Coolant supply

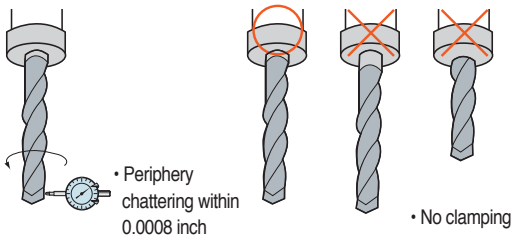

• Supply enough coolant around hole entrance
• Standard cutting oil pressure: 3~5 kg/㎠, Flux: 2~5 l/min

• Supply much coolant at hole entrance

● Mounting drill

• When mounting drill Periphery chattering should be within 0.0008 inch
• Flute should not be clamped

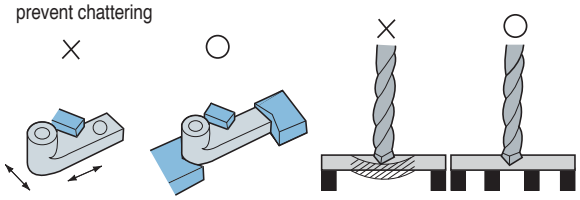

• Periphery chattering within 0.0008 inch

• No clamping flute

● How to clamp workpiece

• At high performance drilling High thrust, torque and horizontal cutting force work at the same time so that workpiece should be clamped strongly to prevent chattering

• Uniformed and strong clamping is needed (Right and left, up and down)

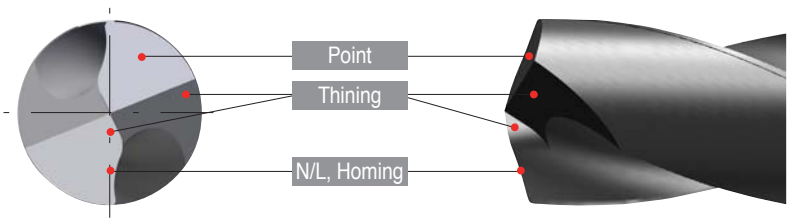

• Strong clamping is needed because bending causes chipping

Notice

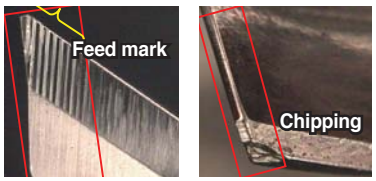

1) For better drill's life, small damage and wear are favorable to be regrinding
2) Damage and wear size should be within 0.06 inch for regrinding
3) If drill has crack, regrinding is impossible
4) Ordering for regrinding is acceptable or purchase regrinding machine

Regrinding procedures

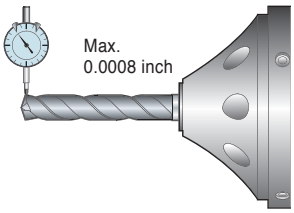

● Regrinding mathod (Mach Drill)

1) Preparation Determination of regrinding areas
- Check the cutting edge for damage and wear If large fracture is found, remove it by rough grinding

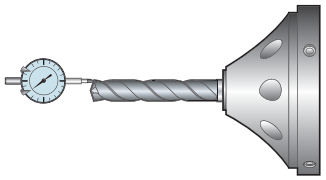

2) Grinding operation Drills setting
- Drill is clamped to collet chuck Chattering is kept within 0.0008 inch

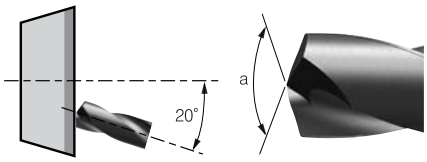

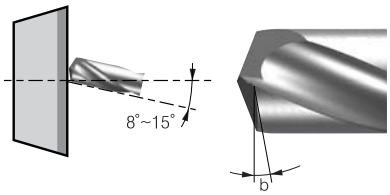

3) Grinding operation-Grinding point

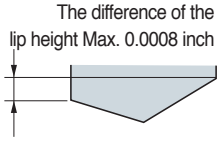

- Check damage and wear at the point and remove it completely
- The difference of the lip height is kept within 0.0008 inch

Point angle (a): 140°
Point relief angle (b)t: 8°~15°

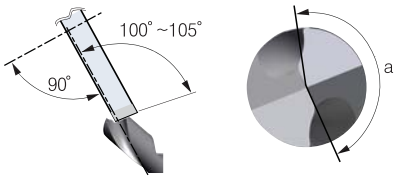

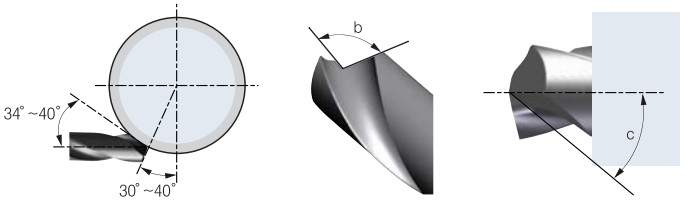

4) Grinding operation-Thinning grinding

- Considering N/L width Cutting edge length from the center of drill axis should be 0.0012~0.0032 inch for balancing

- Set the wheel to tilt drill axis by 34°~40°.

Thinning angle (a)°: 155°~160° Thining open angle (b): 100°~105°
Thinning relief angle (c): 34°~40°

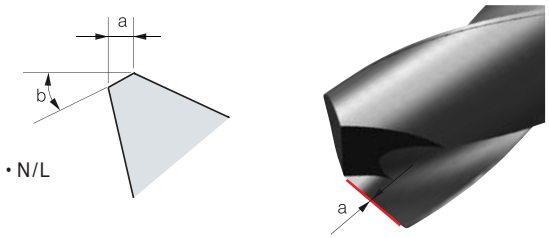

5) Grinding-N/L grinding and honing

- Using diamond chisel Grinds the width flat along point cutting edge
- After negaland operation Finishes with brush or handstone

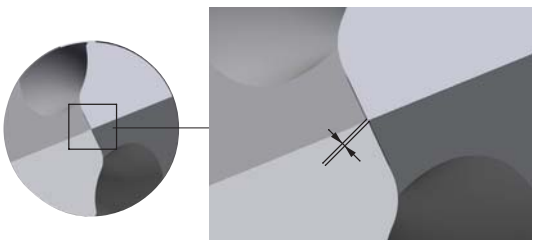

N/L width (a): 0.0020~0.0063 inch /N/L angle (b): 24°~26°

● TIP

· Making point
- Without center drill, the point width should be below 0.004 inch

· Recommended grinding condition
- Diamond wheel: 240~400 mesh
- Diamond chisel: 400~600 mesh
- Diamond hand stone: 800~1500 mesh
